ISO 4363:2002-12 (E)

Measurement of liquid flow in open channels - Methods for measurement of characteristics of suspended sediment

Contents

Page

Foreword iv

Introduction v

1 Scope 1

2 Normative references 1

3 Terms and definitions 1

4 Units of measurement 2

5 Selection of site 3

6 Selection of samplers 3

7 Measurement methods and frequencies 3
7.1 Principle for measurement of cross-sectional mean sediment mass concentration 3
7.2 Principle for measurement and calculation of cross-sectional mean particle size distribution 4
7.3 Conventional method 4
7.4 Simplified method 7
7.5 Distribution and requirements of measurements 8
7.6 Additional information 8
7.7 Source and control of errors 9

8 Calculation 10
8.1 Sediment discharge and mass concentration 10
8.2 Calculation of particle size distribution 11

9 Estimation of random uncertainty and systematic error for measurement of suspended sediment 12
9.1 General 12
9.2 Sources of error 13
9.3 Estimation of component errors 13
9.4 Total random uncertainty for measurement of cross-sectional mean sediment mass concentration 13
9.5 Total systematic error for one measurement of cross-sectional mean sediment mass concentration 14

Annex A (informative) Data collection for determining the error in measurement of cross-sectional mean sediment mass concentration and estimation of errors 15

Annex B (informative) Procedures and examples of methods for combining samples collected in a cross-section 22
