

ISO/TS 16688:2017-11 (E)

Guidelines for the selection of coating types, tests and methods of assessing the performance of coated aluminium in architectural applications

Contents

Page

Foreword	v
1 Scope	1
2 Normative references	1
3 Terms and definitions	1
4 General	3
4.1 Selection of methods to protect metals against corrosion	3
4.2 System for selecting coating types for architectural applications	3
5 Types of environment	4
6 Classification of coatings	7
6.1 Specifications for coated aluminium products	7
6.2 Descriptions of coatings and coating processes	8
6.3 Classifications of anodic oxidation coatings	8
6.4 Classifications of paint coatings	9
6.5 Classifications of combined coatings	10
6.6 Comparison of the classifications	10
7 Coating selection for different environments	10
8 Durability tests	12
8.1 General	12
8.2 Mechanical durability	12
8.2.1 General	12
8.2.2 Deformation	12
8.2.3 Indentation (hardness)	14
8.2.4 Abrasive and adhesive wear	15
8.2.5 Erosion	15
8.3 Chemical durability	16
8.3.1 General	16
8.3.2 Immersion tests	16
8.3.3 Spot and ring tests	19
8.3.4 Poultice or pat tests	20
8.3.5 Tests using an absorbent medium	20
8.3.6 Spray tests	20
8.3.7 Tests involving exposure to vapours or gases	21
8.4 Radiation and heat resistance	21
8.5 Weathering resistance	23
8.5.1 Resistance to artificial weathering	23
8.5.2 Resistance to natural weathering	23
9 Selection of test methods to enable the comparison of different coating types for service in different environments	23
10 Methods of measuring performance	25
10.1 General	25
10.2 Appearance	26

10.2.1	Visible defects	26
10.2.2	Colour	26
10.2.3	Reflectance	27
10.3	Coating integrity	28
10.3.1	Loss of adhesion or cohesion	28
10.3.2	Loss of coating thickness	28
10.3.3	Loss of coating mass or density	29
10.3.4	Change of electrical resistance	29
10.3.5	Increase in absorptivity	30
Annex A (informative) Recommended cleaning procedures for coated aluminium architectural materials		31
