DIN EN 17149-3:2025-05 (E)

Railway applications - Strength assessment of rail vehicle structures - Part 3: Fatigue strength assessment based on cumulative damage

Contents

Page

European foreword 6

Introduction 7

1 Scope 8

2 Normative references 8

3 Terms and definitions 8

4 Stress determination 8
4.1 General 8
4.2 Parent material 9
4.3 Welded joints 9
4.3.1 Modified nominal stresses 9
4.3.2 Structural stresses and notch stresses 9

5 Fatigue strength 9
5.1 Parent material 9
5.1.1 General 9
5.1.2 Component fatigue strength R and R 10
5.1.3 Material properties 10
5.1.4 Design Parameters 11
5.1.5 Fatigue strength factors for direct stresses fR, and for shear stresses fR, ... 13
5.1.6 Correction factor for casting fR,C 14
5.1.7 S-N curves and methods of cumulative damage rule 15
5.2 Welded joints 17
5.2.1 General 17
5.2.2 Fatigue classes C and C 17
5.2.3 Component fatigue strength R and R 18
5.2.4 Influence of thickness fthick and bending 18
5.2.5 Residual stress factors fres, and fres, ... 19
5.2.6 Enhancement factor for post-weld improvement fpost 19
5.2.7 Quality level factor fQL 20
5.2.8 Enhancement factor for the weld inspection class fCT 21
5.2.9 S-N curves and methods of cumulative damage rule 21
5.3 Determination of the fatigue strength of parent material and welded joints by laboratory tests 23

6 Partial factors covering uncertainties 24
6.1 General 24
6.2 Partial factor for loads L 24
6.3 Partial factor for the component fatigue strength M 25
6.3.1 General 25
6.3.2 Partial factor for the consequence of failure M,S 26
6.3.3 Partial factor for the inspection during maintenance M,I 26
6.3.4 Partial factor for the degree of the validation process M,V 27

7 Procedure of the fatigue strength assessment based on cumulative damage calculation 28
7.1 General 28
7.2 Stress determination 29

7.3 Determination of the design stress spectrum 29
7.3.1 Conditioning 29
7.3.2 Stress history adjustment 29
7.3.3 Counting 29
7.3.4 Mean stress adjustment 30
7.3.5 Omission 30
7.4 Damage calculation for each single stress component 31
7.4.1 General 31
7.4.2 Determination of stress spectrum shape factor Aeq 32
7.4.3 Determination of admissible damage sum Dm 32
7.4.4 Determination of the utilization for a single stress component Uc 32
7.5 Assessment of fatigue strength 34
7.6 Critical plane approach 35

Annex A (informative) Procedure for determination of mean stress factors for parent material and welded joints 36

A.1 General 36
A.2 Mean stress sensitivity 36
A.2.1 Parent material 36
A.2.2 Welded joints 37
A.3 Determination of mean stress factors 37

Annex B (informative) Specification example for permissible volumetric defects in steel, iron and aluminium castings 41

B.1 General 41

Annex C (informative) Material factors for parent material 42

Annex D (normative) Fatigue classes C and C for welded joints based on the nominal stress approach 44

D.1 Explanation of the tables for fatigue classes 44
D.1.1 General 44
D.1.2 Number and marking in accordance with EN 15085-3:2022+A1:2023, Table B.1 44
D.1.3 Sketch of the joint 44
D.1.4 Joint specific requirements 45
D.1.5 Potential crack initiation point 45
D.1.6 Feasibility for inspection 45
D.1.7 Relevant thickness for the assessment of a welded joint 45
D.1.8 Material 45
D.1.9 Fatigue classes C and C 46
D.1.10 Exponent m and number of cycles at the knee point of the S-N curve ND 46
D.1.11 Thickness correction exponents n,, n, ...| and n|46
D.1.12 Lower limit of the plate thickness for the thickness correction tmin 46
D.1.13 Parameter bend used for the determination of fbend 46
D.2 Tables of fatigue classes for welded joints 47
D.3 Determination of fatigue strength based on comparative notch case models 82

Annex E (informative) Thickness and bending influence on nominal and structural stress approaches for welded joints 83

E.1 General 83
E.2 Influence quantities 84
E.2.1 Thickness correction factor fthick 84
E.2.2 Enhancement factor for bending fbend 85
E.3 Methods for application of fbend in the assessment process 86
E.3.1 General 86
E.3.2 General ratio method 87
E.3.3 Constant ratio method 87
E.3.4 Comparative notch case model method 87

Annex F (informative) Stress adjustment due to joint geometry for welded joints for nominal stress approach 88

F.1 General 88
F.2 Methods for stress adjustment 88
F.2.1 General 88
F.2.2 Modelling techniques for welded joints 89
F.2.3 Adjustment in the stress evaluation 90

Annex G (informative) Application of structural stress approach for welded joints of steel and aluminium 95

G.1 General for fatigue stress determination on weld toe 95
G.2 Fatigue stress determination with Finite Element method 96
G.2.1 Fatigue stress determination at the weld toe 96
G.2.2 Fatigue stress determination at the root 97
G.3 Fatigue strength assessment with structural stresses 97

Annex H (informative) Application of notch stress approach for welded joints of steel and aluminium 99

H.1 General 99
H.2 Calculation of notch stresses 99
H.2.1 General 99
H.2.2 Reference notch radius rref for modelling of weld notches 100
H.2.3 Modelling of nominal weld cross-sections 100
H.2.4 Methods for notch stress calculation 103
H.3 S-N curves 104
H.3.1 Direct stress transverse to the weld 104
H.3.2 Direct stress longitudinal to the weld 105
H.3.3 Shear stress 105
H.3.4 Characteristic values dependent on thickness effect 105

Annex I (informative) Example for fatigue strength assessment 106

I.1 Description 106
I.2 Task 107
I.3 Assessment 107

Annex J (informative) Flow chart diagrams of the fatigue strength assessment procedure 113
