ISO 20998-3:2017-04 (E)

Measurement and characterization of particles by acoustic methods - Part 3: Guidelines for non-linear theory

Contents

Page

Foreword iv

Introduction v

1 Scope 1

2 Normative references 1

3 Termsanddefinitions 1

4 Symbols and abbreviated terms 1

5 Limits of applicability of linear theory 3
5.1 Multiple scattering 3
5.2 Concentration considerations 3
5.3 Steric repulsion 6

6 Measurement issues in concentrated systems 7
6.1 General 7
6.2 Path length limitation 7
6.3 High attenuation 7
6.4 Increased viscosity 7
6.5 Change in velocity 7
6.6 Change in pulse shape 8
6.7 Homogeneity 8

7 Nonlinear attenuation 8

8 Determination of particle size 8
8.1 Calculation 8
8.2 Limits of application 9

9 Instrumentqualification 9
9.1 Calibration 9
9.2 Precision 9
9.2.1 Reference materials 9
9.2.2 Repeatability 9
9.2.3 Reproducibility 9
9.3 Accuracy 9
9.3.1 Qualification procedure 9
9.3.2 Reference materials 10
9.3.3 Instrument preparation 10
9.3.4 Accuracy test 10
9.3.5 Qualification acceptance criteria 10

10 Reporting of results 10

Annex A (informative) Theories of attenuation in concentrated systems 11

Annex B (informative) Practical example of PSD measurement (coupled phase model) 14

Bibliography 22
