DIN EN 15026:2023-12 (E)

Hygrothermal performance of building components and building elements - Assessment of moisture transfer by numerical simulation

Contents

Page

European foreword 5

Introduction 6

1 Scope 8

2 Normative references 8

3 Terms, definitions, symbols and units 8

4 Hygrothermal formulae and material properties 10
4.1 Assumptions 10
4.2 Balance formulae 11
4.2.1 General 11
4.2.2 Internal energy density 11
4.2.3 Additional source terms 12
4.3 Relations between driving potentials and conserved quantities 12
4.4 Transport of heat and moisture 12
4.4.1 General 12
4.4.2 Heat and enthalpy transport inside materials 12
4.4.3 Moisture transport 13
4.4.4 Moisture transport across material interfaces/vapour retarders/foils 14
4.4.5 Internal air layers 15
4.5 Material properties 15

5 Boundary and initial conditions 15
5.1 Inside conditions 15
5.1.1 Usage conditions 15
5.1.2 Parameters 16
5.1.3 Sources of data 16
5.2 Outside conditions 16
5.2.1 Sources of data 16
5.2.2 Climate parameters 17
5.3 Interpolation of tabulated climatic data 17
5.4 Boundary heat and moisture flows 18
5.4.1 Heat transfer 18
5.4.2 Vapour diffusion 21
5.4.3 Convective latent heat flow 21
5.4.4 Wind driven rain 21
5.5 Initial conditions 22

6 Numerical simulation 22
6.1 Background 22
6.2 Geometrical modelling 23
6.3 Grid and time step sensitivity studies 23

7 Documentation of input data and results 24
7.1 General 24
7.2 Problem description 24
7.2.1 General 24
7.2.2 Scope and subject of simulation 24

7.3 Model geometry and input parameters 24
7.3.1 Simulated geometry 24
7.3.2 Initial conditions 24
7.3.3 Boundary conditions 24
7.3.4 Material parameters 25
7.3.5 Auxiliary models 25
7.3.6 Output specifications 25
7.4 Simulation method and numerical properties 25
7.4.1 General 25
7.4.2 Simulation tool 25
7.4.3 Numerical simulation properties 25
7.4.4 Numerical accuracy control 26
7.5 Calculation report 26
7.5.1 General 26
7.5.2 Display of results 26
7.5.3 Interpretation of the results 26

Annex A (informative) Material parameters 28

A.1 General 28
A.2 Heat storage 28
A.3 Heat transport 28
A.4 Moisture storage 30
A.5 Moisture transport properties 31
A.5.1 General 31
A.5.2 Water vapour diffusion resistance 31
A.5.3 Liquid transport properties 33
A.6 Material-related model limitations 34
A.6.1 General 34
A.6.2 Influence of material boundaries on liquid moisture transport 34
A.6.3 Hysteresis phenomena 34
A.6.4 Swelling 35
A.6.5 Weathering and ageing 35

Annex B (normative) Benchmark tests 36

B.1 General 36
B.1.1 General background 36
B.1.2 Reference implementation 36
B.2 Problem description 36
B.3 Results 38
B.4 Other benchmark cases and validation suites 40

Annex C (informative) Moisture design years 41

Annex D (normative) Inside boundary conditions for residential and office buildings 42

Annex E (normative) Auxiliary models for the simplified inclusion of special effects 43

E.1 General 43
E.2 Rear ventilation and venting of building components 43
E.3 Condensation caused by air flow through building components 44
E.4 Wind driven rain penetration 45

Bibliography 47
