ISO 20685-1:2018 (E)

3-D scanning methodologies for internationally compatible anthropometric databases — Part 1: Evaluation protocol for body dimensions extracted from 3-D body scans

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Accuracy of extracted measurements

4.1 Selection of extracted measurements
4.2 Standard values

5 Research design for a validation study to establish accuracy of body dimensions extracted from scanners

5.1 General
5.2 Validation study procedures
5.3 Sampling size and test subject selection
5.4 Analytical procedures
5.5 Validation study reporting

6 Method for estimating the number of subjects needed

Annex A (informative) Methods for reducing error in 3#D scanning

A.1 General
A.2 Subjects
A.2.1 General
A.2.2 Anatomical landmarks
A.2.3 Scanning attire
A.2.4 Subject position
A.3 Hardware
A.3.1 General
A.3.2 Resolution
A.3.3 Test and calibration
A.3.3.1 Calibration
A.3.3.2 Test object
A.3.3.3 Test measurements
A.3.3.4 Accuracy
A.3.3.5 Repeatability
A.3.3.6 Statistics
A.3.3.7 Multiple cameras
A.3.4 Scanning volume
A.3.5 Scanning duration
A.3.6 Additional sources of error
A.4 Software
A.4.1 General
A.4.2 Features for human-figure manipulation
A.4.2.1 Zoom
A.4.2.2 Pan or translate
A.4.2.3 Rotate
A.4.2.4 Floating axis

A.4.3 Features of landmark identification
A.4.4 Features of segmentation
A.4.5 Features of measurement extraction
A.4.5.1 Manual measurements
A.4.5.2 Automatic measurements
A.4.6 Data storage
