

Calculation methods for energy efficiency and energy consumption variations at country, region and city levels

Contents

	Foreword
	Introduction
1	Scope
2	Normative references
3	Terms and definitions
4	Factors to be calculated
4.1	General
4.1.1	Overview of methods included in the document
4.1.2	Objectives of calculations
4.1.3	Types of explanatory factors to be calculated
4.1.3.1	General
4.1.3.2	Energy intensity
4.1.3.3	Energy consumption variation
4.1.3.4	Energy efficiency indices
4.2	Indicators, methods and applications
4.2.1	Indicators
4.2.2	Types of data used
4.2.3	Structure effects
4.2.4	Indicator choice for energy efficiency and energy savings calculation
4.2.5	Climatic corrections of energy consumption
5	Evaluation of structure effects in the variation of energy intensity
5.1	General
5.2	Calculation methods
5.2.1	Introduction to the calculation of structure effect
5.2.2	Decomposition of the energy intensity variation with the Divisia method
5.3	Calculation issues related to structure effects
5.3.1	General
5.3.2	Options of calculation of the Divisia decomposition
5.3.3	Disaggregation level
5.3.4	Chained or unchained calculation
6	Calculation of energy efficiency indices
6.1	Objective and overview of calculation
6.2	General calculation
6.2.1	General
6.2.2	Step 1: Selection of subsectors or energy uses
6.2.3	Step 2: Choice of indicators
6.2.4	Step 3: Calculation of indicator values
6.2.5	Step 4: Calculation of indicator trends as index
6.2.6	Step 5: Calculation of weighting factors
6.2.7	Step 6: Calculation of energy efficiency indices by sector
6.2.8	Step 7: Calculation of an overall energy efficiency index
6.3	Computational issues in the calculation of the energy efficiency indices
6.3.1	General
6.3.2	Options for calculation
6.3.2.1	Base year versus previous year
6.3.2.2	Smoothed indicator values

- 6.3.3 Indicators resulting in negative energy efficiency improvement
- 6.4 Reliability of energy efficiency indices
 - 6.4.1 General
 - 6.4.2 Status of data sources
 - 6.4.3 Appropriateness of the indicator
 - 6.4.4 Length of period
- 7 Decomposition analysis of energy consumption variation
 - 7.1 Objective and overview of calculation
 - 7.2 General calculation
 - 7.2.1 General
 - 7.2.2 Definition of explanatory factors
 - 7.2.3 Calculation of the activity factor
 - 7.2.4 Calculation of the energy savings factor
 - 7.2.5 Calculation of structure effects
 - 7.2.6 Calculation of other factors
 - 7.3 Other issues related to the decomposition of the energy consumption variation
 - 7.3.1 General
 - 7.3.2 Calculation over a period
 - 7.3.3 Indicators resulting in negative energy efficiency improvement

Annex A (informative) Calculation of structure effects

- A.1 Simple calculation of an energy intensity at constant structure
 - A.1.1 General
 - A.1.2 Simple calculation for industry
 - A.1.3 Simple calculation for final energy intensity
- A.2 Example of a calculation of Divisia decomposition

Annex B (informative) Examples of energy efficiency indicators

- B.1 General
- B.2 Industry
 - B.2.1 Selection of subsectors
 - B.2.2 Indicators for energy-intensive industries
 - B.2.3 Indicators for other industrial branches
 - B.2.4 Example of a calculation of an energy efficiency index
- B.3 Transport
 - B.3.1 Selection of subsectors
 - B.3.2 Indicators for cars
 - B.3.3 Indicators for buses and motorcycles
 - B.3.4 Indicators for passenger and freight rail transport and for air transport
- B.4 Residential (households)
 - B.4.1 Selection of subsectors
 - B.4.2 Indicators for space heating
 - B.4.3 Indicators for water heating
 - B.4.4 Indicators for cooking
 - B.4.5 Indicators for air cooling and large appliances
 - B.4.6 Indicators for lighting

Annex C (informative) Examples of explanatory factors

- C.1 General
- C.2 Activity factor
 - C.2.1 Industry
 - C.2.2 Transport
 - C.2.3 Households
 - C.2.4 Services
- C.3 Structure effects
 - C.3.1 Industry
 - C.3.2 Transport
 - C.3.3 Services
- C.4 Other factors

Annex D (informative) Climatic corrections of energy consumption
