# ISO/TS 16393:2019 (E)

## Molecular biomarker analysis — Determination of the performance characteristics of qualitative measurement methods and validation of methods

# Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Characterization of a qualitative method via a validation experiment

- 4.1 Criteria for a standard measurement method
- 4.2 Performance of a validation experiment
- 4.3 Nature of test materials
- 4.4 Requirements for replicate test samples
- 4.5 Robustness (ruggedness)
- 4.6 Applicability
- 4.7 Selectivity
- 4.8 Experimental design for a multi-laboratory study
- 4.8.1 Participating laboratories
- 4.8.2 Number of laboratories
- 4.8.3 Number of levels
- 4.8.4 Number of replicates per level and laboratory
- 4.9 Validation experiment under intermediate conditions
- 4.10 Expressing the results of a validation experiment
- 4.10.1 General
- 4.10.2 Graphical representation of the data
- 4.11 Calculation of the confidence interval for the general mean, confidence interval and prediction interval
- 4.12 Calculation of prediction interval for PODs in each laboratory

5 Statistical model for test result

- 5.1 General
- 5.2 Basic model
- 5.3 Constraints in the model
- 5.4 General mean, m
- 5.5 Variance parameters
- 5.6 Relationship of qualitative model to the quantitative model
- 5.7 Derivation of a limit of detection

Annex A (informative) Estimation of the mean and variance

- A.1 Single laboratory experiment
- A.2 Multi-laboratory experiment
- A.3 Calculation of variances of a multi-laboratory experiment

Annex B (informative) Hybrid modified Wilson interval model

- B.1 General
- B.2 Method for estimating LPOD, P αλ 95 % confidence intervals
- B.3 Transition point on x (number positive)

Annex C (informative) Maximum profile likelihood based on the probit model

Annex D (informative) Maximum likelihood estimate based on beta binomial distribution

Annex E (informative) Testing of the models via simulation
