ISO 22753:2021 (E)

Molecular biomarker analysis — Method for the statistical evaluation of analytical results obtained in testing sub-sampled groups of genetically modified seeds and grains — General requirements

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Principle

4.1 General
4.2 Preparation of seed/grain groups
4.3 Detection methods for the qualitative analysis of GM seed/grain in seed/grain groups
4.4 Statistical evaluation

5 Reagents

6 Apparatus and equipment

7 Design of testing plan

7.1 General
7.2 Single-stage testing plan
7.3 Double-stage testing plan

8 Selection of qualitative methods

8.1 General
8.2 Performance criteria

9 Interpretation

10 Expression of results

10.1 Classification of a seed/grain lot into “accept” or “reject” category
10.2 Estimation of the level of molecular biomarker in the seed/grain lot

11 Test report

Annex A (informative) Terms and definitions comparison table

A.1 Comparison of terms defined other documents

Annex B (informative) Implementation of the method to evaluate GMO content in seeds/grains example

B.1 Example 1: Group testing to evaluate GMO content in maize grains
B.1.1 General
B.1.2 Analytical purpose
B.1.3 Properties of the analytical method
B.2 Example 2: Group testing to evaluate GMO content in seeds
B.2.1 Analytical purpose
B.2.2 Properties of the analytical method
B.3 Example 3: Implementation of the method to evaluate GMO purity in seeds
B.3.1 General
B.3.2 Analytical purpose
B.3.3 Properties of the analytical approach

B.3.4 Analytical method
B.3.5 Interpretation of results

Annex C (informative) Estimation of the limit of detection for a testing plan to detect GM seeds/grains in seed lots

C.1 General
C.2 Calculations
C.3 The effect of genome size on the number of analytical group size
C.4 The effect of seed size on sample preparation

Annex D (informative) Experimental determination of maximum group size

D.1 General
D.2 Experimental procedure
