DIN EN ISO 23691:2026-11 (E)

Microbiology of the food chain - Determination and use of cardinal values (ISO 23691:2026)

Contents

Page

Foreword ..... **v**

Introduction ..... **vi**

1 Scope **1**

2 Normative references **2**

3 Terms and definitions **2**

4 Principle **6**
4.1 General 6
4.2 Gamma functions 7
4.2.1 General 7
4.2.2 Describing effects of temperature 7
4.2.3 Describing effects of *pH* 8
4.2.4 Describing effects of a_w 8
4.2.5 Describing the effects of concentrations of inhibitors 9
4.3 Process of cardinal values and food correction factor determination 10
4.4 Determination of the maximum specific growth rate 10
4.4.1 General 10
4.4.2 Binary dilution OD-based method 11
4.4.3 Direct plating method 11
4.5 Cardinal values determination 12
4.6 Correction factor determination 13
4.7 Validation 14
4.8 Use of cardinal values and food correction factor in predictions 15

5 Reagents and materials **15**

6 Apparatus **15**

7 Experimental design and data collection **16**
7.1 General 16
7.2 Preparation of culture and medium 16
7.2.1 Choice and storage of studied strain 16
7.2.2 Preparation and inoculation of the microbial culture 17
7.2.3 Preparation of the modified nutrient broth 17
7.3 Levels per factor to estimate cardinal values 18
7.3.1 General 18
7.3.2 Temperature 18
7.3.3 pH 19
7.3.4 Water activity 20
7.3.5 Inhibitory compounds 21
7.4 Experimental design to estimate the maximum specific growth rate from the binary dilution OD-based method 22
7.5 Experimental design to estimate the maximum specific growth rate from the direct plating method 23
7.6 Determination of the food correction factor based on a challenge test 23
7.7 Validation 24

8 Expression of the results: Estimation of the growth parameters **24**
8.1 General 24

8.2 Assessment of maximum specific growth rate at each level of intrinsic or extrinsic factors (first step) 24
8.2.1 General 24
8.2.2 Assessment of maximum specific growth rates from direct plating data 25
8.2.3 Assessment of maximum specific growth rates by binary dilution OD-based method 25
8.3 Assessment of cardinal values and optimum growth rate in broth, μ_{Broth} (second step) 25
8.4 Assessment of C_f (third step) 26
8.5 Validation (fourth step) 27
9 Use of cardinal values to perform microbial growth predictions 28
9.1 General 28
9.2 Prerequisites for growth predictions 28
9.3 Using cardinal values to simulate growth 29
9.3.1 Growth simulation at a static given temperature 29
9.3.2 Growth prediction with dynamic time-temperature scenario 30
9.3.3 Growth simulation at a static condition of temperature, *pH* and a_w 31
10 Test report 33
11 Quality assurance 33
Annex A (informative) **Indicative list of tools for primary and secondary fittings and simulations 34**
Annex B (informative) **Guidance to obtain different a_w values when using different humectants in broth 37**
Annex C (informative) **Growth rate determination 38**
Annex D (informative) **Plate design 42**
Annex E (informative) **Example of the use of cardinal values for growth simulation and its variation 43**
Bibliography 46
