DIN ISO 10816 Beiblatt 1:2013-12 (E)

Mechanical vibration - Evaluation of machine vibration by measurements on non-rotating parts - Supplement 1: Methodology for selecting machinery vibration standards, including the shaft vibration (ISO/TR 19201:2013)

Contents

Page

Foreword 3

1 Scope 4

2 International Standards 4
2.1 Basic machinery vibration standards 4
2.2 Related machinery vibration standards 5
2.3 Additional machinery vibration standards 5

3 Terms and definitions 6

4 Evaluation of machine vibration 6
4.1 General 6
4.2 Machinery vibration standards and criteria 6
4.3 Classification of severity of machine vibration 7
4.4 Measurement procedures and instrumentation 7
4.5 Vibration standards summaries 7

5 Measurements made on non-rotating parts 8

6 Measurements made on rotating parts 11

7 Related standards 12

8 Analytical guidelines for selecting the appropriate vibration standard for a specific machinery 14
8.1 General 14
8.2 Basic relations for rotating shaft and pedestal vibration 17

Annex A (informative) Bearing dynamics 19

Annex B (informative) Pedestal dynamic stiffness 22

Annex C (informative) Examples of typical values of dynamic stiffness for bearings and pedestals 23

Annex D (informative) Dynamic stiffness of the bearing part combined with the pedestal 25

Annex E (informative) International machinery vibration standards shown by application area 27
