ISO 2631-5:2018 (E)

Mechanical vibration and shock — Evaluation of human exposure to whole-body vibration — Part 5: Method for evaluation of vibration containing multiple shocks

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms, definitions and symbols

4 Delineation of the two exposure regimes

5 Description of the model

5.1 Vibration measurement
5.1.1 General considerations
5.1.2 Measurement location and specific hardware requirements
5.1.3 Signal conditioning
5.1.4 Measurement duration
5.2 Determination of spinal response
5.3 Calculation of spinal response dose

Annex A (informative) Alternative model for the determination of spinal response during exposures without loss of contact with seat surface

A.1 General
A.2 Measurement of acceleration time series
A.3 Software
A.3.1 Software input and output (orientating analysis)
A.3.2 Calculation of intervertebral forces
A.3.3 Calculation of a compressive dose

Annex B (informative) General relationship between acceleration dose and health effects

Annex C (informative) Assessment of health effects for exposures that are described in Clause 5

Annex D (informative) Example of digital implementation of transfer function for exposures that are described in Clause 5

Annex E (informative) Assessment of health effects for exposures without loss of contact with seat surface

E.1 General
E.2 Software input and output (individual analysis)
E.3 Risk factor
E.4 Transfer function for one set of conditions
