ISO 17201-3:2019 (E)

Acoustics — Noise from shooting ranges — Part 3: Sound propagation calculations

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Source modelling

- 4.1 General
- 4.2 Muzzle blast
- 4.2.1 Background
- 4.2.2 Free-field situation
- 4.2.3 Non-free-field situation
- 4.2.3.1 Shooting shed
- 4.2.3.2 More complex situations
- 4.3 Projectile sound

5 Propagation calculation

- 5.1 General
- 5.2 Application of ISO 9613-2 for free-field situations
- 5.3 Application of ISO 9613-2 for non-free-field situations
- 5.4 Sophisticated models

6 Conversion of sound exposure levels

7 Uncertainties

Annex A (normative) Benchmark cases for shooting sheds with baffles

- A.1 General
- A.2 Benchmark case
- A.2.1 Model shed
- A.2.2 Computational method
- A.3 Results
- A.4 Example of use of the benchmark case

Annex B (informative) Sophisticated modelling approaches

- B.1 Preliminary remarks
- B.2 Kirchhoff approximation
- B.3 Ray-tracing models
- B.4 Maekawa approximation

Annex C (informative) Modelling of shooting scenarios — Examples of shooting ranges

- C.1 Preliminary remarks
- C.2 Free-field ranges
- C.2.1 General overview
- C.2.2 Free-field shooting range — First site
- C.2.3 Free-field shooting range — Second site
- C.3 Free-field shooting range with barrier
- C.4 Shooting shed
- C.5 Shooting facility

Annex D (informative) Uncertainty

D.1 Preliminary remarks
D.2 Prediction of uncertainty — Functional relationship
D.3 Contributions to prediction uncertainty
D.4 Uncertainty concerning the angular source energy distribution level
D.4.1 General
D.4.2 Uncertainty resulting from the modelling of substitute source or sources
D.4.3 Uncertainty resulting from the modelling of the actual situation
D.4.4 Uncertainty concerning the actual shooting direction and position of the sound source
D.4.5 Uncertainties resulting from the used sound propagation model
D.4.6 Combined and expanded prediction uncertainty
