

ISO 532-3:2023-07 (E)

Acoustics - Methods for calculating loudness - Part 3: Moore-Glasberg-Schlittenlacher method

Contents		Page
Foreword		iv
Introduction		v
1	Scope	1
2	Normative references	1
3	Terms and definitions	1
4	General	4
5	Input signal	4
5.1	Single microphone	4
5.2	Two microphones in the ear canals or microphones in a head and torso simulator	4
5.3	Earphone presentation	4
6	Instrumentation	5
7	Description of the method	5
7.1	General	5
7.2	Transfer of sound through the outer and middle ear	6
7.2.1	General	6
7.2.2	Free-field transfer function	7
7.2.3	Diffuse-field transfer function	8
7.2.4	Signal recorded using microphones in the ear canals or using a Head and Torso Simulator	8
7.2.5	Earphone presentation	8
7.3	Calculation of the running short-term spectrum	8
7.4	Calculation of the running short-term excitation pattern	9
7.5	Transformation of excitation into specific loudness	10
7.5.1	General	10
7.5.2	Reference excitation at the reference threshold of hearing	10
7.5.3	Gain of the cochlear amplifier for inputs with low sound pressure levels	11
7.5.4	Calculation of specific loudness from excitation when $ETHRQ/E_0 \leq E/E_0$	11
7.5.5	Calculation of specific loudness from excitation when $ETHRQ/E_0 > E/E_0$	12
7.5.6	Calculation of specific loudness from excitation when $E/E_0 > 1010$	12
7.6	Calculation of short-term specific loudness	13
7.7	Smoothing of short-term specific loudness and application of binaural inhibition	13
7.8	Calculation of short-term loudness	15
7.9	Calculation of long-term loudness	15
7.10	Relationship between loudness level and loudness	15
7.11	Calculation of the reference threshold of hearing	16
8	Uncertainty of calculated loudness sounds	17
9	Data reporting	17
Annex A (informative)	Software for the calculation of loudness according to the method in this document	19

Annex B (informative) Test signals used for verification of this document	21
Annex C (informative) Test signals used for verification of equivalence with ISO 532-2	24
Bibliography	28
