ISO 1328-2:2020-02 (E)

Cylindrical gears - ISO system of flank tolerance classification - Part 2: Definitions and allowable values of double flank radial composite deviations

Contents

Page

Foreword iv

1 Scope 1

2 Normative references 1

3 Terms, definitions and symbols 1
3.1 Terms and definitions 1
3.2 Symbols 3

4 Application of the ISO double flank radial composite tolerance classification system 3
4.1 General 3
4.2 Gear tooth tolerance class 4
4.3 Specification of datum surfaces 4
4.4 Application of the ISO flank classification standard 5
4.4.1 Measurement equipment and master gears 5
4.4.2 Equipment verification and uncertainty 5
4.4.3 Filtering and data density 5
4.5 Acceptance criteria 5
4.6 Correlation of double flank radial composite and element deviations 5
4.7 Designation of the double flank radial composite tolerance class or tolerances 6

5 Tolerance values 6
5.1 General 6
5.2 Use of formulae 6
5.2.1 Number of teeth used to calculate tolerances 6
5.2.2 Rounding rules 6
5.3 Tooth-to-tooth radial composite tolerance, fidT 7
5.4 Total radial composite tolerance, FidT 7
5.4.1 Total radial composite tolerance for cylindrical gears 7
5.4.2 Total radial composite tolerance for sector gears 7

Annex A (informative) Graph of tolerance values for class R34, R44, and R50 for spur gears with module = 1,0 mm 8

Annex B (informative) Double flank radial composite deviation over segments of k teeth 10

Annex C (informative) Reasons for changing double flank composite tolerances 12

Annex D (informative) Conversion from another double flank composite tolerance specification 13

Annex E (informative) Calculation examples 14
