DIN EN 1177:2018-03 (E)

Impact attenuating playground surfacing - Methods of test for determination of impact attenuation

Contents

Page

European foreword 4

Introduction 6

1 Scope 8

2 Normative references 8

3 Terms and definitions 8

4 Test apparatus 9
4.1 Suitability 9
4.2 Components of the apparatus 10
4.3 Accuracy of apparatus 12
4.3.1 Calibration by a laboratory 12
4.3.2 Checks by operators 12

5 Testing procedure 13
5.1 Principle of impact measurement 13
5.2 Selection and definition of test positions 14

6 Test Method 1 - Determination of Critical Fall Height (CFH) 15
6.1 Principle 15
6.2 Testing in the laboratory 15
6.3 Testing on site 17

7 Test Method 2 - Determination of Impact Attenuation on site 18
7.1 Principle 18
7.2 Selection and recording of test positions 18
7.3 Carrying out the test 19
7.4 Results 19

8 Reports 19
8.1 General 19
8.2 Tests carried out in the laboratory with Method 1 19
8.3 Tests carried out on site in accordance with Method 1 20
8.4 Tests carried out on site in accordance with Method 2 21

Annex A (informative) Test rig for determination of impact attenuation 22

Annex B (informative) Typical examples of trace of acceleration against time and curve of HIC and gmax values against drop height 23

Annex C (informative) Verification of computer algorithm used for the calculation of HIC (see 4.3.1.4) 25

Annex D (normative) Procedure for selection of test positions in playgrounds for Method 2 (see Clause 7) 26

D.1 Principle 26
D.2 Criteria for selection of test zones (3.12) 26

Annex E (normative) Method for compaction of loose particulate impact attenuating material (see 6.2.4.5.1) 31

E.1 General 31
E.2 Measurement of layer thickness 31
E.3 Compaction procedure 31

Annex F (informative) Example of a regime for checking the function of an HIC test apparatus 33
