

DIN EN 1177:2018-03 (E)

Impact attenuating playground surfacing - Methods of test for determination of impact attenuation

Contents	Page
European foreword	4
Introduction	6
1 Scope	8
2 Normative references	8
3 Terms and definitions	8
4 Test apparatus	9
4.1 Suitability	9
4.2 Components of the apparatus	10
4.3 Accuracy of apparatus	12
4.3.1 Calibration by a laboratory	12
4.3.2 Checks by operators	12
5 Testing procedure	13
5.1 Principle of impact measurement	13
5.2 Selection and definition of test positions	14
6 Test Method 1 - Determination of Critical Fall Height (CFH)	15
6.1 Principle	15
6.2 Testing in the laboratory	15
6.3 Testing on site	17
7 Test Method 2 - Determination of Impact Attenuation on site	18
7.1 Principle	18
7.2 Selection and recording of test positions	18
7.3 Carrying out the test	19
7.4 Results	19
8 Reports	19
8.1 General	19
8.2 Tests carried out in the laboratory with Method 1	19
8.3 Tests carried out on site in accordance with Method 1	20
8.4 Tests carried out on site in accordance with Method 2	21
Annex A (informative) Test rig for determination of impact attenuation	22
Annex B (informative) Typical examples of trace of acceleration against time and curve of HIC and gmax values against drop height	23
Annex C (informative) Verification of computer algorithm used for the calculation of HIC (see 4.3.1.4)	25
Annex D (normative) Procedure for selection of test positions in playgrounds for Method 2 (see Clause 7)	26
D.1 Principle	26
D.2 Criteria for selection of test zones (3.12)	26

Annex E (normative) Method for compaction of loose particulate impact attenuating material (see 6.2.4.5.1)	31
E.1 General	31
E.2 Measurement of layer thickness	31
E.3 Compaction procedure	31

Annex F (informative) Example of a regime for checking the function of an HIC test apparatus 33
