

ISO 4363:2002-12 (E)

Measurement of liquid flow in open channels - Methods for measurement of characteristics of suspended sediment

Contents		Page
Foreword		iv
Introduction		v
1	Scope	1
2	Normative references	1
3	Terms and definitions	1
4	Units of measurement	2
5	Selection of site	3
6	Selection of samplers	3
7	Measurement methods and frequencies	3
7.1	Principle for measurement of cross-sectional mean sediment mass concentration	3
7.2	Principle for measurement and calculation of cross-sectional mean particle size distribution	4
7.3	Conventional method	4
7.4	Simplified method	7
7.5	Distribution and requirements of measurements	8
7.6	Additional information	8
7.7	Source and control of errors	9
8	Calculation	10
8.1	Sediment discharge and mass concentration	10
8.2	Calculation of particle size distribution	11
9	Estimation of random uncertainty and systematic error for measurement of suspended sediment	12
9.1	General	12
9.2	Sources of error	13
9.3	Estimation of component errors	13
9.4	Total random uncertainty for measurement of cross-sectional mean sediment mass concentration	13
9.5	Total systematic error for one measurement of cross-sectional mean sediment mass concentration	14
Annex A (informative)	Data collection for determining the error in measurement of cross-sectional mean sediment mass concentration and estimation of errors	15
Annex B (informative)	Procedures and examples of methods for combining samples collected in a cross-section	22
