

ISO 13675:2013-11 (E)

Heating systems in buildings - Method and design for calculation of the system energy performance - Combustion systems (boilers)

Contents		Page
Foreword		iv
Introduction		v
1	Scope	1
2	Normative references	1
3	Terms, definitions and symbols	1
3.1	Terms and definitions	1
3.2	Symbols and units	4
4	Alignment of the parts of the heating system standards	5
4.1	Physical factors taken into account	5
4.2	Input quantities from other parts of the heating system standards	6
4.3	Output quantities for other parts of the heating system standards	6
4.4	Heat balance of the generation sub-system, including control of heat generation	7
4.5	Generation sub-system basic energy balance	8
5	Generation sub-system calculation	9
5.1	Available methodologies	9
5.2	Boiler efficiency	10
Annex A (informative)	Additional formulas and default values for parametering the boiler efficiency method	19
Annex B (informative)	General part default values and information	31
Annex C (normative)	Maximum heating power in the building zone	32
Annex D (informative)	Calculation examples for modulating condensing boiler	35
Annex E (informative)	Generation sub-systems and gross calorific values	39
