Page

Foreword iv

Introduction v

1 Scope 1

2 Normative references 1

3 Termsanddefinitions 2

4 Symbols and abbreviated terms 7

5 Principle of the method 9
5.1 Flowchart of the calculation method 9
5.2 System boundary 13
5.3 Physical factors 13
5.4 Schematization of the heat pump for heating and cooling 14
5.5 Input and output of the calculation method 16
5.6 Energy input needed to meet the heat requirements for electrically driven heat pumps 16
5.7 Auxiliary energy, WHW,gen,aux 17
5.8 Recoverable, recovered, and unrecoverable heat losses 17
5.9 Calculation periods 18
5.10 Calculation by zones 18

6 Generation subsystem calculation 19
6.1 Input data 19
6.2 Energy requirements for space heating, space cooling, and DHW mode 20
6.3 Tabulated values of the COP for heating and cooling at full load 20
6.4 Heat losses through the generator envelope 20
6.5 Calculation of back-up heater 22
6.6 Running time of the heat pump 24
6.7 Auxiliary energy 32
6.8 Total losses and total recoverable heat loss of the generation subsystem 33
6.9 Calculation of total energy input 35
6.10 Summary of output values 40

Annex A (informative) Construction of COP matrix with a single test result 41

Annex B (informative) Calculation of the COP based on interpolation of values 51

Annex C (informative) Calculation of heat pump COP and thermal capacities at part load conditions 57

Annex D (informative) Model of heat pump in the BEST program 65

Annex E (informative) Energy evaluation for other kinds of heat pumps ("CO2 heat pump water heater" and "air-conditioner and water heater combined systems") 97
