## Heating and cooling systems in buildings - Method for calculation of the system performance and system design for heat pump systems - Part 2: Energy calculation

---

| <b>Contents</b>       |  | <b>Page</b> |
|-----------------------|--|-------------|
| Foreword .....        |  | iv          |
| Introduction .....    |  | v           |
| 1                     | Scope .....  | 1           |
| 2                     | Normative references .....   | 1           |
| 3                     | Terms and definitions .....  | 2           |
| 4                     | Symbols and abbreviated terms .....  | 7           |
| 5                     | Principle of the method .....  | 9           |
| 5.1                   | Flowchart of the calculation method .....  | 9           |
| 5.2                   | System boundary .....  | 13          |
| 5.3                   | Physical factors .....   | 13          |
| 5.4                   | Schematization of the heat pump for heating and cooling .....  | 14          |
| 5.5                   | Input and output of the calculation method .....   | 16          |
| 5.6                   | Energy input needed to meet the heat requirements for electrically driven heat pumps .....   | 16          |
| 5.7                   | Auxiliary energy, $W_{HW,gen,aux}$ .....   | 17          |
| 5.8                   | Recoverable, recovered, and unrecoverable heat losses .....  | 17          |
| 5.9                   | Calculation periods .....  | 18          |
| 5.10                  | Calculation by zones .....   | 18          |
| 6                     | Generation subsystem calculation .....   | 19          |
| 6.1                   | Input data .....   | 19          |
| 6.2                   | Energy requirements for space heating, space cooling, and DHW mode .....   | 20          |
| 6.3                   | Tabulated values of the COP for heating and cooling at full load .....   | 20          |
| 6.4                   | Heat losses through the generator envelope .....   | 20          |
| 6.5                   | Calculation of back-up heater .....  | 22          |
| 6.6                   | Running time of the heat pump .....  | 24          |
| 6.7                   | Auxiliary energy .....   | 32          |
| 6.8                   | Total losses and total recoverable heat loss of the generation subsystem .....   | 33          |
| 6.9                   | Calculation of total energy input .....  | 35          |
| 6.10                  | Summary of output values .....   | 40          |
| Annex A (informative) | Construction of COP matrix with a single test result .....   | 41          |
| Annex B (informative) | Calculation of the COP based on interpolation of values .....  | 51          |
| Annex C (informative) | Calculation of heat pump COP and thermal capacities at part load conditions .....  | 57          |
| Annex D (informative) | Model of heat pump in the BEST program .....   | 65          |
| Annex E (informative) | Energy evaluation for other kinds of heat pumps ("CO <sub>2</sub> heat pump water heater" and "air-conditioner and water heater combined systems") ..... | 97          |
| Bibliography .....    |  | 115         |
