

ISO 18434-2:2019 (E)

Condition monitoring and diagnostics of machine systems — Thermography — Part 2: Image interpretation and diagnostics

Contents

	Foreword
	Introduction
1	Scope
2	Normative references
3	Terms and definitions
4	Thermal condition monitoring
4.1	Application of thermal imaging within condition monitoring programmes
4.2	Correlation with other technologies
4.3	Performance monitoring
5	Equipment choice
5.1	Lens choice
5.2	Infrared windows and sight glasses
5.3	IR camera characteristics
5.3.1	General
5.3.2	Image capture speed
5.3.3	Wavelength choice
5.3.4	Camera lens filters
6	Data collection
6.1	Thermogram and photograph content
6.2	Error sources, accuracy and repeatability
6.2.1	IR camera location
6.2.2	Emissivity
6.2.3	Focus, range and distance
6.2.4	Machine operating conditions
6.2.5	Environmental conditions
6.2.6	Calibration
7	Machine bearing location identification convention
8	Severity criteria
8.1	Baseline measurements
8.2	Typical guidelines
9	Image interpretation guidelines
10	Diagnosing thermodynamic problems
10.1	General principles
10.2	Heat generation
10.2.1	General
10.2.2	Surface friction
10.2.3	Fluid friction
10.2.4	Electrostatic discharge heating
10.2.5	Electrical (induced current) discharge heating
10.2.6	Exothermic reaction heating
10.2.7	Electromagnetic heating
10.2.8	Compression heating

- 10.2.9 Material cyclic deformation heating
- 10.2.10 Electrical resistance heating
- 10.3 Abnormal heat distribution
- 10.4 Applied heat
- 10.5 Heat loss
- 10.6 Heat transfer

Annex A (informative) Case examples
