ISO 22278:2020 (E)

Fine ceramics (advanced ceramics, advanced technical ceramics) — Test method for crystalline quality of single-crystal thin film (wafer) using XRD method with parallel X-ray beam

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Fundamentals

5 Devices and instruments

- 5.1 Schematic diagrams
- 5.2 X-ray generator
- 5.3 X-ray mirror
- 5.4 Monochromator
- 5.5 Sample attachment
- 5.6 Goniometer
- 5.7 Detector
- 5.8 Instrument calibration

6 Preparation of sample

7 Test method and procedure

- 7.1 Optics alignment
- 7.2 Sample alignment
- 7.3 Adjusting the initial position of goniometer
- 7.3.1 Symmetric diffraction
- 7.3.2 Asymmetric diffraction
- 7.4 Microscopic position adjustment of goniometer (Φ and χ axes) and ω scan
- 7.4.1 Symmetric diffraction
- 7.4.2 Asymmetric diffraction
- 7.5 Crystalline quality measurement method of single-crystal wafer
- 7.5.1 General
- 7.5.2 Selecting the flat zone position of wafer
- 7.5.3 Arranging the fixed size of the square
- 7.5.4 Measuring the FWHM value of RC
- 7.5.5 Interference effect by the wafer's curvature
- 7.5.6 Doped epitaxy film on a single-crystal thin film substrate

8 Data analysis

9 Test report

Annex A (informative) Example of d-spacing, 2θ, χ value (tilt angle) and relative ideal intensity of the symmetric and asymmetric diffraction on the SiC single-crystal thin film (wafer)

Annex B (informative) Determination of d-spacing, 2θ, χ value (tilt angle) and relative ideal intensity for the symmetric and asymmetric diffraction on the single-crystal thin film (wafer)

- B.1 General
- B.2 Method for determining d-spacing and 2θ calculation

B.3 Method for determining χ value (tilt angle) for measuring peaks in single crystals
B.4 Method for determining relative ideal intensities and structure factors

Annex C (informative) Results of interlaboratory test
