ISO 18518:2025-09 (E)

Magnetic fusion facilities - Requirements for the safety systems raised by the application of the superconducting technology

Contents

Page

Foreword iv

Introduction v

1 Scope 1

2 Normative references 1

3 Terms and definitions 1

4 Application of superconductivity in fusion facilities 4
4.1 Overview of the superconducting magnet system 4
4.1.1 General 4
4.1.2 Cryogenic technology needed in superconducting magnet system 4
4.1.3 Auxiliary systems to the superconducting magnet system 5
4.2 Safety systems present in fusion facilities 5
4.2.1 Confinement system 5
4.2.2 Nuclear shielding system 5
4.2.3 Auxiliary safety system 6

5 Requirementsforconfinementsystem 6
5.1 General 6
5.2 Requirements associated with the presence of superconducting magnets 6
5.3 Protection of confinement system against magnetic energy 7
5.4 Protection of confinement system against other hazard 7

6 Requirements for radiation protection 8
6.1 Safe operation 8
6.2 Maintenance and repairability 8

7 Requirementsspecifictoothersystems 10
7.1 Plasma performance monitoring system 10
7.2 Magnetic diagnosis and monitoring system 10
7.3 Quench detection and protection system 10
7.4 Diagnosis and monitoring system in support of confinement systems 11
7.5 Other requirements 11

Annex A (informative) Example of Paschen curve 12

Annex B (informative) Examples of radiation design limits for super-conducting coils in ITER and DEMO 13

Annex C (informative) Examples of peak factors used in the ITER one dimensional neutronic design analyses 14

Annex D (informative)Vacuumvessel,firstwallandblanketexamples 15

Annex E (informative) Arcing prevention in superconducting magnets 17

Bibliography 19
