Magnetic fusion facilities - Requirements for the safety systems raised by the application of the superconducting technology

Contents		Page
Foreword		iv
Introduction		v
1	Scope	1
2	Normative references	1
3	Terms and definitions	1
4	Application of superconductivity in fusion facilities	4
4.1	Overview of the superconducting magnet system	4
4.1.1	General	4
4.1.2	Cryogenic technology needed in superconducting magnet system	4
4.1.3	Auxiliary systems to the superconducting magnet system	5
4.2	Safety systems present in fusion facilities	5
4.2.1	Confinement system	5
4.2.2	Nuclear shielding system	5
4.2.3	Auxiliary safety system	6
5	Requirements for confinement system	6
5.1	General	6
5.2	Requirements associated with the presence of superconducting magnets	6
5.3	Protection of confinement system against magnetic energy	7
5.4	Protection of confinement system against other hazard	7
6	Requirements for radiation protection	8
6.1	Safe operation	8
6.2	Maintenance and reparability	8
7	Requirements specific to other systems	10
7.1	Plasma performance monitoring system	10
7.2	Magnetic diagnosis and monitoring system	10
7.3	Quench detection and protection system	10
7.4	Diagnosis and monitoring system in support of confinement systems	11
7.5	Other requirements	11
Annex A (informative)	Example of Paschen curve	12
Annex B (informative)	Examples of radiation design limits for super-conducting coils in ITER and DEMO	13
Annex C (informative)	Examples of peak factors used in the ITER one dimensional neutronic design analyses	14
Annex D (informative)	Vacuum vessel, first wall and blanket examples	15
Annex E (informative)	Arcing prevention in superconducting magnets	17
Bibliography		19
