DIN EN 10319-2:2007-01 (E)

Metallic materials - Tensile stress relaxation testing - Part 2: Procedure for bolted joint models

Contents

Page

Foreword 3

1 Scope 4

2 Normative references 4

3 Terms and definitions 4

4 Symbols and designations 5

5 Principle 6

6 Apparatus 6
6.1 Bolted joint model device 6
6.1.1 General 6
6.1.2 Bolted joint model A 7
6.1.3 Bolted joint model bolt B 7
6.2 Extension measuring device 7
6.2.1 Measuring device for the overall length 7
6.2.2 Measuring device for the strain 7
6.3 Heating device 7
6.3.1 General purpose 7
6.3.2 Permissible temperature deviations 7
6.3.3 Temperature measurement 8
6.3.4 Calibration of the thermocouples and temperature measuring system 8

7 Shape, dimensions and preparation of bolted joint models 9
7.1 Shape and dimensions 9
7.2 Preparation 10
7.3 Determination of the original cross-sectional area 10

8 Test procedure 10
8.1 General 10
8.2 Tensioning of the bolt 10
8.2.1 General 10
8.2.2 Tensioning with bolted joint model A 11
8.2.3 Tensioning with bolted joint model B 11
8.3 Determination of the initial stress of the bolt 11
8.4 Heating, holding at temperature and cooling of the bolted joint model 11
8.5 Determination of the residual elastic strain 11
8.5.1 General 11
8.5.2 Unloading the bolt 12
8.5.3 Residual elastic strain with bolted joint model A 12
8.5.4 Residual elastic strain with bolted joint model B 12
8.5.5 Determination of the residual stress 12

9 Accuracy of the results 13
9.1 Expression of the results 13
9.2 Uncertainty 13

10 Test report 13

Annex A (informative) Information concerning different types of thermocouples 21

Annex B (informative) Information concerning methods of calibration of thermocouples 22

Bibliography 23
