ISO 8559-3:2018 (E)

Size designation of clothes — Part 3: Methodology for the creation of body measurement tables and intervals

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Principles related to the methodology of the creation of the body measurement tables

4.1 General
4.2 Selection of the explanatory variables and the dependent variable (statistical methodology)

5 Categories of body measurement tables

5.1 "Statistic" tables
5.2 "Linearly smoothed" tables

6 Choice of the data

6.1 General
6.2 Homogeneous population: improvement in relation to sub-groups of the population
6.2.1 General
6.2.2 “Infants” group
6.2.3 “Children” group (girls and boys)
6.2.4 “Girls” group
6.2.5 “Boys” group
6.2.6 “Women” group
6.2.7 “Men” group

7 Decisions on intervals and ranges

7.1 Intervals
7.2 Range
7.3 Examples — Men
7.3.1 Explanatory variable based on height
7.3.2 Explanatory variable based on chest girth

Annex A (informative) Clothing industry needs related to anthropometric data

Annex B (informative) Example of a body measurement table content

Annex C (informative) Statistical models commonly used for the creation of body measurement tables

C.1 General
C.2 Multiple linear regression models with two explanatory variables
C.3 Simple linear regression model (with one explanatory variable)
C.4 Alternative models

Annex D (informative) Tasks in statistics

D.1 General
D.2 Statistical tasks
D.2.1 Task 1 — Selection of the studied population
D.2.2 Task 2 — Verification of the normality of each measurement
D.2.3 Task 3 — Validation of the regression model

D.2.3.1 General
D.2.3.2 Analysis of variance (known as ANOVA)
D.2.3.3 Student's t test
D.2.3.4 The coefficient of determination, R2
D.2.4 Task 4 — Detection of aberrant individuals
D.2.5 Task 5 — Verification of the new model
D.2.6 Task 6 — Graphical representations of the model validation
D.2.7 Task 7 — Residual analysis
D.2.8 Task 8 — Verification of the consistency of the results
D.2.9 Task 9 — Calculation of the value of each dependent measurement, in relation to the explanatory variables
