ISO 20041-1:2022-07 (E)

Tritium and carbon-14 activity in gaseous effluents and gas discharges of nuclear installations - Part 1: Sampling of tritium and carbon-14

Contents

Page

Foreword iv

Introduction v

1 Scope 1

2 Normative references 1

3 Terms and definitions 1

4 Symbols 6

5 Sampling location 7
5.1 General 7
5.2 General selection of sampling locations 8
5.3 Criteria for the homogeneity of the sampling locations 8
5.4 Design of gaseous effluent discharge systems for sampler positioning 9

6 Sampling systems 9
6.1 General 9
6.2 Evaluation of an existing sampling system 9
6.3 Volumetric flow rate measurement 10
6.3.1 General 10
6.3.2 Effluent flow rate measurement 10
6.3.3 Sampling volume and flow rate measurement 10
6.3.4 Leak tightness checks 11
6.4 Gas and vapour transport and sampling 12
6.4.1 General 12
6.4.2 General provisions 12
6.4.3 Special case of tritium 14
6.4.4 Special case of carbon-14 15
6.5 Sampling techniques 15
6.5.1 General 15
6.5.2 Sampling by bubbling technique (tritium and carbon-14) 15
6.5.3 Sampling using molecular sieves (tritium and carbon-14) 20
6.5.4 Sampling by condensation (only tritium) 24

7 Sampling sheet and follow-up sheet 24
7.1 General 24
7.2 Sampling sheet 24
7.3 Follow-up sheet 25

Annex A (informative) Example of a sampling sheet (bubbling technique/molecular sieve method) 26

Annex B (informative) Techniques for measurement of flow rate through ducts and stacks 28

Annex C (informative) Range of use of tritium and carbon-14 sampling devices in gaseous effluents 32

Annex D (informative) Feedback on penetration values of gases in sampling systems 33

Bibliography 36
