DIN EN 12299:2025-01 (E)

Railway applications - Ride comfort for passengers - Measurement and evaluation

Contents

Page

European foreword 6

1 Scope 8

2 Normative references 8

3 Terms and definitions 8

4 Symbols, units and abbreviations 10

5 General description 14
5.1 General 14
5.2 Passenger exposure to vibrations 14
5.3 Application 15
5.4 Characteristics of rail vehicle motions 15
5.5 Ride comfort 16
5.6 Direct and indirect measurements 16
5.7 Summary table of procedures 16
5.8 Application of comfort indices 17

6 Mean comfort and continuous comfort 18
6.1 General 18
6.2 Basis of the method 19
6.3 Methodology 19
6.4 Test conditions 19
6.4.1 General 19
6.4.2 Selection of test sections 20
6.4.3 Test speed 20
6.4.4 Wheel-rail contact geometry 20
6.4.5 Vehicle condition 20
6.5 Parameters to be measured 20
6.5.1 General 20
6.5.2 Location of measuring points 21
6.5.3 Filtering 21
6.6 Definition of intermediate quantities 21
6.7 Definition of comfort indexes 23
6.7.1 Continuous comfort 23
6.7.2 Mean comfort standard method 23
6.7.3 Mean comfort complete method 24
6.8 Test report 24

7 Comfort on curve transitions 24
7.1 General 24
7.2 Basis of the method 24
7.3 Methodology 25
7.4 Test conditions 25
7.4.1 General 25
7.4.2 Selection of test sections 25
7.4.3 Test speed 25
7.4.4 Wheel-rail contact geometry 25
7.4.5 Vehicle condition 25
7.5 Parameters to be measured 26

7.5.1 General ... 26
7.5.2 Location of measuring points ... 26
7.5.3 Filtering ... 26
7.6 Definition of intermediate quantities ... 26
7.6.1 Symbols and indices ... 26
7.6.2 Averaging procedure ... 26
7.6.3 Identification of transition periods ... 27
7.6.4 Intermediate quantities ... 28
7.7 Definition of comfort index PCT ... 30
7.8 Alternative comfort index `sliding PCT over 3 s' ... 31
7.9 Test report ... 33

8 Comfort on discrete events ... 33
8.1 General ... 33
8.2 Basis of the method ... 34
8.3 Methodology ... 34
8.4 Test conditions ... 34
8.4.1 General ... 34
8.4.2 Selection of test sections ... 34
8.4.3 Test speed ... 35
8.4.4 Wheel-rail contact geometry ... 35
8.4.5 Vehicle condition ... 35
8.5 Parameters to be measured ... 35
8.5.1 General ... 35
8.5.2 Location of measuring points ... 35
8.5.3 Filtering ... 35
8.6 Definition of quantities ... 35
8.6.1 Symbols and indices ... 35
8.6.2 Averaging procedure to obtain the mean value ... 36
8.6.3 Maximum peak to peak value ... 36
8.7 Definition of comfort index PDE ... 37
8.8 Test report ... 37

9 Guide for the interpretation of results ... 37
9.1 General ... 37
9.2 Mean comfort ... 37
9.3 Continuous comfort ... 38
9.4 Comfort on curve transitions ... 39
9.5 Comfort on discrete events ... 39

Annex A (normative) Reference system ... 40

Annex B (normative) Measurement techniques ... 42

B.1 General ... 42
B.2 Measuring equipment ... 42
B.2.1 General ... 42
B.2.2 Transducers and signal amplifiers ... 42
B.2.3 Recording equipment ... 43
B.2.4 Fixing transducers to the floor ... 43
B.3 Seat measuring devices and their applications ... 43

Annex C (normative) Weighting curves ... 46

C.1 General ... 46
C.2 Filter functions ... 47
C.2.1 General ... 47
C.2.2 Band-limiting filter ... 47
C.2.3 Acceleration to velocity transition ... 48
C.2.4 Upward gradient ... 48
C.2.5 Overall frequency weighting ... 48
C.2.6 Reduction of the upper limit of the frequency range in vertical direction ... 48

C.3 Tolerances 48
C.4 Diagrams 50

Annex D (informative) Specifying the vehicle performance with regard to ride comfort 54

D.1 General 54
D.2 Knowledge of route for comfort assessment 54
D.3 Track condition 54
D.4 Specification of vehicle conditions 55
D.5 General specification 55

Annex E (normative) Vehicle assessment with respect to ride comfort 56

E.1 General 56
E.2 Track geometric quality 56
E.3 Test conditions 57
E.3.1 Selection of test sections and test zones 57
E.3.2 Test speed 57
E.3.3 Wheel-rail contact geometry 57
E.3.4 Vehicle condition 57
E.4 Acceptable modifications of the methods for the continuous or mean comfort evaluation 58
E.5 Test report 60

Annex F (informative) Presentation of test report 61

F.1 General 61
F.2 Aim of test 61
F.3 Test performer 61
F.4 References 61
F.5 Test conditions 61
F.5.1 General information 61
F.5.2 Vehicle 62
F.5.3 Seat (for mean comfort complete method) 62
F.5.4 Seat occupant (for mean comfort complete method) 62
F.5.5 Track 62
F.5.6 Speed profile 63
F.5.7 Test configurations 63
F.6 Measurements and processing 63
F.6.1 Measurements 63
F.6.2 Processing 63
F.6.3 Deviations 63
F.7 Report on mean comfort and continuous comfort 63
F.7.1 General 63
F.7.2 Time series 63
F.7.3 Statistical results 64
F.7.4 Comfort evaluation 64
F.7.5 Spectral analyses 64
F.8 Report on comfort in curve transitions 68
F.9 Reporting on comfort on discrete events 69

Annex G (informative) Guideline for the application of direct tests 71

Annex H (informative) Workflow for calculation of RMS from measured (or simulated) time series of accelerations 72

Annex I (informative) Determining quantities 73

Annex J (informative) Guidance for the application of simulation 75

J.1 General 75
J.2 Benefits 75

J.3 Applications 75
J.4 Accuracy and limitations 76
J.5 State of the art for railway ENs 76

Annex K (informative) Unit Value for the mean comfort index 78

K.1 Unit value definition 78
K.2 Simple example 78
K.3 Maximum simplification 79
K.4 Vehicle orientated simplification 80
K.5 Test zone orientated simplification 80
K.6 Ride comfort distribution 81
K.7 Combination of simplifications 81
K.8 Full analysis 81
K.9 Applying the NMV comfort index scale 81
