DIN 1045-1:2008-08 (E)

Plain, reinforced and prestressed concrete structures - Part 1: Design and construction

Contents

Page

Foreword 6

Introduction 7

1 Scope 7

2 Normative references 8

3 Terms, definitions and symbols 9
3.1 Terms and definitions 9
3.2 Quantities and symbols 12
3.2.1 Latin upper case symbols (without subscripts) 12
3.2.2 Latin lower case letters (without subscripts) 13
3.2.3 Greek symbols (without subscripts) 13
3.2.4 Subscripts 14
3.2.5 Latin upper case symbols (with subscripts) 16
3.2.6 Latin lower case symbols (with subscripts) 18
3.3 SI units 26

4 Documentation 26
4.1 Scope 26
4.2 Drawings 26
4.2.1 General requirements 26
4.2.2 Erection drawings for precast elements 27
4.2.3 Drawings of formwork and falsework 27
4.3 Design analysis 28
4.4 Specification of works 28

5 Safety concept 28
5.1 General 28
5.2 Design resistance 28
5.3 Ultimate limit state 29
5.3.1 General 29
5.3.2 Ductility 29
5.3.3 Partial safety factors for actions and resistances at ultimate limit state 30
5.3.4 Combinations of actions and design situations 31
5.4 Serviceability limit states 31
5.4.1 General 31
5.4.2 Requirement classes 32

6 Durability 32
6.1 General 32
6.2 Exposure classes and minimum concrete strength 32
6.3 Concrete cover 36

7 Basis of structural analysis 38
7.1 Requirements 38
7.2 Imperfections 39
7.3 Idealizations and simplifications 40
7.3.1 Effective flange width, load dispersal and effective span 40
7.3.2 Other simplifications 43

8 Methods of analysis 45
8.1 General 45
8.2 Linear-elastic analysis 45
8.3 Linear-elastic analysis with redistribution of moments 46
8.4 Plastic analysis 46
8.4.1 General 46
8.4.2 Simplified analysis of plastic rotation for members predominately subjected to bending . 47
8.5 Non-linear analysis 48
8.5.1 General 48
8.5.2 Basis of calculation for linear members and one-way spanning slabs subjected to bending with or without coexistent axial force 49
8.6 Linear members and walls in axial compression (second order theory) 50
8.6.1 General 50
8.6.2 Classification of structures and members 51
8.6.3 Methods of analysis 52
8.6.4 Imperfections 54
8.6.5 Model column method 54
8.6.6 Compression members with biaxial eccentricity 57
8.6.7 Plain concrete compression members 59
8.6.8 Lateral displacement of slender beams 60
8.7 Prestressed structures 61
8.7.1 General 61
8.7.2 Prestressing force 62
8.7.3 Loss of prestress 63
8.7.4 Serviceability limit state 64
8.7.5 Ultimate limit state 65
8.7.6 Anchorage zones of pre-tensioned members 65
8.7.7 Anchorage zones of post-tensioned or unbonded members 68

9 Materials 69
9.1 Concrete 69
9.1.1 General 69
9.1.2 Strength 69
9.1.3 Deformation characteristics 69
9.1.4 Creep and shrinkage 70
9.1.5 Stress-strain curve for non-linear methods of analysis and for strain calculations 74
9.1.6 Stress-strain curve for section design 75
9.1.7 Characteristic values of concrete 76
9.2 Reinforcement 79
9.2.1 General 79
9.2.2 Properties 79
9.2.3 Stress-strain curve for global analysis 81
9.2.4 Stress-strain curve for section design 82
9.3 Prestressing steel 83
9.3.1 General 83
9.3.2 Properties 83
9.3.3 Stress-strain curve for section design 84

10 Analyses for the ultimate limit state 85
10.1 General 85
10.2 Bending, axial force and coexistent bending and axial force 85
10.3 Shear 86
10.3.1 Methods of analysis 86
10.3.2 Design shear force 87
10.3.3 Members not requiring design shear reinforcement 88
10.3.4 Members requiring design shear reinforcement 90
10.3.5 Shear between web and flange 93
10.3.6 Shear transfer in joints 94
10.3.7 Unreinforced members 97
10.4 Torsion 97
10.4.1 General 97

10.4.2 Methods of analysis 98
10.4.3 Warping torsion 101
10.4.4 Unreinforced members 101
10.5 Punching shear 101
10.5.1 General 101
10.5.2 Loaded areas and critical sections used in analyses 102
10.5.3 Analysis 106
10.5.4 Slabs or foundations without punching shear reinforcement 108
10.5.5 Slabs or foundations containing punching shear reinforcement 109
10.5.6 Minimum bending moments 111
10.6 Strut-and-tie models 113
10.6.1 General 113
10.6.2 Design of struts and ties 113
10.6.3 Design of nodes 115
10.7 Partial area loading 116
10.8 Fatigue analysis 117
10.8.1 General 117
10.8.2 Internal forces and stresses at ultimate limit state 118
10.8.3 Methods of analysis 119
10.8.4 Simplified analyses 121

11 Analyses for the serviceability limit state 123
11.1 Limitation of stresses 123
11.1.1 General 123
11.1.2 Limitation of compressive stresses in concrete 123
11.1.3 Limitation of stresses in the reinforcement 123
11.1.4 Limitation of stresses in prestressing steel 123
11.2 Crack control and check for decompression 124
11.2.1 General 124
11.2.2 Minimum reinforcement for limitation of crack width 125
11.2.3 Control of cracking without detailed analysis 129
11.2.4 Calculation of crack width 132
11.3 Limitation of deformations 134
11.3.1 General 134
11.3.2 Simplified method to check control of deformations in reinforced concrete members 135

12 Detailing arrangements for reinforcement and tendons 136
12.1 General 136
12.2 Spacing of bars 136
12.3 Bending of steel 136
12.3.1 Mandrel diameter 136
12.3.2 Rebending 137
12.4 Bonding conditions 138
12.5 Design bond stress 138
12.6 Anchorage of longitudinal reinforcement 140
12.6.1 General 140
12.6.2 Anchorage length 142
12.6.3 Shear reinforcement 142
12.7 Anchorage of links and shear reinforcement 143
12.8 Joints 146
12.8.1 General 146
12.8.2 Lap length 147
12.8.3 Shear reinforcement 148
12.8.4 Layered reinforcing fabric 149
12.9 Bundles of bars 150
12.10 Tension members (tendons) 152
12.10.1 General 152
12.10.2 Pre-tensioned members 153
12.10.3 Post-tensioned members 153
12.10.4 Unbonded members 153
12.10.5 Couplers 154

13 Detailing arrangements for structural members 154
13.1 Members predominately subjected to bending 154
13.1.1 Maximum and minimum reinforcement 154
13.1.2 Top reinforcement in prestressed members 155
13.2 Beams and T-beams 157
13.2.1 General 157
13.2.2 Resistance to tension 157
13.2.3 Shear reinforcement 159
13.2.4 Torsion reinforcement 161
13.2.5 Top reinforcement in members with large bar diameters 161
13.3 Solid slabs cast in-situ 162
13.3.1 Minimum thickness 162
13.3.2 Resistance to tension 162
13.3.3 Shear and punching shear reinforcement 164
13.4 Prefabricated floor systems 166
13.4.1 General 166
13.4.2 Load dispersal 166
13.4.3 Floor decks with in-situ topping 167
13.4.4 Diaphragm action 169
13.5 Columns 169
13.5.1 General 169
13.5.2 Limitations on area of longitudinal reinforcement 170
13.5.3 Shear reinforcement 170
13.6 Deep beams 171
13.7 Walls 171
13.7.1 Reinforced concrete walls 171
13.7.2 Wall-to-ceiling connections in precast construction 172
13.7.3 Sandwich panels 173
13.7.4 Unreinforced walls 173
13.8 Connection and support of precast elements 174
13.8.1 General 174
13.8.2 Compression joints 174
13.8.3 Rigid and high-strength connections 176
13.8.4 Zones of support 176
13.9 Zones of load transfer 176
13.9.1 Compression 176
13.9.2 Tension 176
13.10 Forces associated with changes in direction 176
13.11 Indirect support 176
13.12 Limitation of damage due to accidental actions 177
13.12.1 General 177
13.12.2 Peripheral ties 178
13.12.3 Internal ties 178
13.12.4 Horizontal wall and column ties 179
