ISO/TS 19700:2016-09 (E)

Controlled equivalence ratio method for the determination of hazardous components of fire effluents - Steady-state tube furnace

Contents

Page

Foreword v

Introduction vi

1 Scope 1

2 Normative references 2

3 Terms and definitions 2

4 Principle 3

5 Apparatus 4
5.1 General apparatus 4
5.2 Tubular furnace 4
5.3 Calibrated thermocouples 6
5.4 Quartz furnace tube 6
5.5 Combustion boat 6
5.6 Combustion boat drive 7
5.6.1 Mechanism 7
5.6.2 Rate of specimen introduction 7
5.7 Mixing and measurement chamber 8
5.8 Analysis of gases 8
5.9 Determination of smoke aerosols 10
5.10 Exhaust system 10

6 Air supplies 10
6.1 Primary and secondary air supplies 10
6.2 Primary airflow calibration 10
6.3 Secondary airflow calibration 11
6.4 Overall confirmation 11

7 Establishment of furnace temperature and setting of furnace temperature 11
7.1 General 11
7.2 Establishing furnace temperature profile to determine furnace suitability 12
7.3 Setting the temperature for an individual test run condition 12

8 Test specimen preparation 13
8.1 Test specimen form 13
8.2 Combustible loading 13
8.3 Specimen conditioning 13

9 Selection of test decomposition conditions 13
9.1 Selection of decomposition conditions for fire hazard analysis or fire safety engineering13 9.2 Stage 1b): oxidative pyrolysis from externally applied radiation 14
9.3 Stage 2: well-ventilated flaming 14
9.4 Stage 3a): small vitiated fires in closed or poorly ventilated compartments 15
9.5 Stage 3b): post-flashover fires in open compartments 16

10 Procedure 16
10.1 Safety considerations 16

10.2 Decomposition of the test specimen ... 16
10.3 Steady-state period ... 18
10.4 Sampling and analysis of fire effluent ... 18
10.4.1 General ... 18
10.4.2 Sampling of fire effluent ... 18
10.4.3 Determination of the mass of the specimen residue ... 20
10.4.4 Ambient conditions ... 20
10.5 Validity of test run ... 21

11 Calculations ... 21
11.1 General ... 21

11.2 Mass-charge concentration and mass-loss concentration ... 21
11.2.1 Mass-charge concentration ... 21
11.2.2 Mass-loss concentration ... 21
11.3 Yield ... 22
11.4 Organic fraction ... 24

12 Test report ... 24
12.1 of test report ... 24
12.2 Test laboratory details ... 25
12.3 Specimen details ... 25
12.4 Test conditions and procedures ... 25

13 Verification of test apparatus with PMMA ... 26
13.1 Procedure ... 26
13.2 Verification criteria ... 26

14 Trueness and uncertainties with respect to steady-state tube furnace concentration and yields ... 26
14.1 Accuracy, trueness and uncertainty ... 26
14.2 Accuracy and trueness of concentration and yield measurements in the steady- state tube furnace (SSTF) ... 26
14.3 Extent of variability of concentration and yield measurements from test specimens in the steady-state tube furnace ... 27
14.4 Correlation of effluent yields from the steady-state tube furnace with those obtained from large-scale compartment fire tests under the same combustion conditions ... 27

15 Repeatability and reproducibility ... 28

Annex A (informative) Guidance on the choice of additional decomposition conditions ... 30

Annex B (informative) Estimation of lethal toxic potency for combustion products according to ISO 13344 using tube-furnace data ... 32

Annex C (informative) Application of data from the tube-furnace test to estimation and assessment of toxic hazard in fires according to ISO 13571 ... 33

Annex D (informative) Use of the tube-furnace method for bioassay purposes ... 34

Annex E (informative) Measurement of optical density from the steady-state tube furnace ... 35

Annex F (informative) Comparison of data from the steady-state tube furnace, the ISO 9705 room and other compartment fire experiments ... 37

Annex G (informative) Assessment of mass-loss rate data ... 41

Bibliography ... 46
