ISO 23932-1:2018 (E)

Fire safety engineering — General principles — Part 1: General

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Overview of the FSE process

5 Set FSE project scope

6 Identify FSOs

- 6.1 General
- 6.2 Life safety
- 6.3 Property protection
- 6.4 Continuity of operations
- 6.5 Protection of the environment
- 6.6 Protection of heritage

7 Identify FRs

8 Select risk analysis approach

- 8.1 General
- 8.2 Comparative versus absolute approach
- 8.3 Qualitative analysis
- 8.4 Deterministic analysis
- 8.5 Probabilistic analysis
- 8.5.1 General
- 8.5.2 Semi-quantitative risk analysis
- 8.5.3 Quantitative risk analysis

9 Identify PCs

10 Create fire safety design plan

11 Determine design scenarios

- 11.1 General
- 11.2 Hazard identification
- 11.3 Design fire scenarios
- 11.4 Design occupant behavioural scenarios

12 Select engineering methods

- 12.1 General
- 12.2 Fire models
- 12.3 Evacuation models
- 12.4 Validation and verification
- 12.5 Data from test methods and surveys
- 12.6 Analysis of results from reference fire scenario test
- 12.7 Engineering judgement

13 Evaluate design

13.1 General
13.2 Quantification of design scenarios
13.2.1 Input data
13.2.2 Estimation of consequence
13.2.3 Estimation of frequency of occurrence
13.3 Uncertainty
13.4 Comparison with PCs
13.5 Identify other affected FSOs

14 Document in final report

14.1 General
14.2 FSE assessment
14.3 Conditions of use of the built environment
14.4 Inspection and maintenance procedures
14.5 Forms of documentation
14.6 Global project review
14.7 Agreement of relevant regulatory authorities

15 Implement fire safety design plan

15.1 Identification and treatment of changes
15.2 Check of built environment conformity
15.3 Update of project documentation

16 Execute fire safety management

16.1 General
16.2 Fire safety management
16.2.1 Requirement for fire safety management
16.2.2 Fire safety manual
16.2.3 Liaison with fire service
16.3 Inspection
16.4 Life-cycle analysis
