Foreword iv

Introduction v

1 Scope 1

2 Normative references 1

3 Termsanddefinitions 1

4 Background/Technical introduction 1
4.1 General 1
4.2 Power 1
4.3 Prism 2

5 Ad hoc work group activity summary 2
5.1 Background 2
5.2 Literature search 2
5.3 Initial spectacle lens surfacing laboratory practice survey 3
5.3.1 General 3
5.3.2 Observations and conclusions from the limited study 3
5.3.3 Historical comment 3
5.4 Global survey/questionnaire (see Annex D) 3
5.5 Executive summary of the global survey sent to ISO/TC172/SC7/WG3 4

6 Detailed lens power assessment methodologies 4
6.1 Two-parameter and three-parameter methods 4
6.1.1 General 4
6.1.2 Impact of the differences in the power assessment methodologies 6
6.1.3 Power assessment methodologies considered in the survey 6
6.1.4 Numerical comparison of the two- and three-parameter methods 6
6.2 A mean sphere (spherical equivalent power) and cylinder method 7
6.3 A mean sphere (spherical equivalent power) and astigmatic difference method 8
6.4 Scalar or root mean square (RMS) power error 9
6.5 Introduce a tiered approach with different optical classes 9

7 Detailed lens prism assessment methodologies 9
7.1 General 9
7.2 Marking of the reference points and uncertainties in positioning 10
7.3 Single-vision position-specific lenses and power-variation lenses 11

8 Summary 11
8.1 Power 11
8.2 Prism imbalance 12

Annex A (informative) Example prescription jobs showing three-parameter (ISO) compared with two-parameter (ANSI) power tolerance methodology differences 13

Annex B (informative) Australian spectacle lens surfacing laboratory -- Tolerance capability study . 15

Annex C (informative) Literature search 23

Annex D (informative)ReportofthelSOwebsurveyintolensverificationmethods--World- wide results . 26

Annex E (informative)Verificationpower,useofautomatedfocimeterssetto0,25D,0,12Dor 0,06Dsteps 45

Annex F (informative) Methods of determining the unwanted cylindrical error or scalar power error 47

Bibliography 49
