ISO 13474:2009-06 (E)

Acoustics - Framework for calculating a distribution of sound exposure levels for impulsive sound events for the purposes of environmental noise assessment

Contents

Page

Foreword v

Introduction vi

1 Scope 1

2 Normative references 1

3 Terms and definitions 2

4 Basic equations 6
4.1 General 6
4.2 Probability of occurrence 6
4.3 Band sound exposure level 7
4.4 Frequency-weighted sound exposure level 8
4.5 Long-term average single-event sound exposure level 8
4.6 Equivalent level from multiple events 10

5 Calculation of a statistical distribution 10

6 Calculation of attenuation 14
6.1 General 14
6.2 Geometric divergence 14
6.3 Atmospheric absorption 14
6.4 Insertion loss by screening objects 15
6.5 Terrain shielding 15
6.6 Contributions to excess attenuation 16
6.6.1 General 16
6.6.2 Refraction 16
6.6.3 Ground reflection and absorption 17

7 Classification 19
7.1 General 19
7.2 Classification of atmospheric absorption 19
7.3 Classification of excess attenuation 19
7.3.1 General 19
7.3.2 Lookup table requirements 20
7.3.3 Range-dependent sound speed profiles 21
7.3.4 Directed sound speed profiles 21

8 Probability of occurrence of sound speed profiles 22
8.1 General 22
8.2 Using direct measurements of wind and temperature profiles 22
8.3 Similarity relationships for the atmospheric surface layer 23
8.4 Using measurements of turbulent fluxes 24
8.5 Using routinely gathered weather station data 25
8.6 Using directly measured or calculated sound speed profiles as input 26

9 The source 26
9.1 General 26
9.2 Demolition and muzzle blasts 26

9.2.1 General 26
9.2.2 Source descriptors 27
9.2.3 Determination by measurement 27
9.2.4 Determination by estimation 28
9.3 Projectile sound 28
9.3.1 General 28
9.3.2 Flat trajectories 28
9.3.3 High-elevation trajectories and rocket trajectories 28

10 Uncertainties 28

Annex A (informative) Example of the estimation of the statistical distribution of single-event sound exposure levels 30

Annex B (informative) Uncertainty 37
