Acoustics - Framework for calculating a distribution of sound exposure levels for impulsive sound events for the purposes of environmental noise assessment

Contents		Page
Foreword		v
Introduction		vi
1	Scope	1
2	Normative references	1
3	Terms and definitions	2
4	Basic equations	6
4.1	General	6
4.2	Probability of occurrence	6
4.3	Band sound exposure level	7
4.4	Frequency-weighted sound exposure level	8
4.5	Long-term average single-event sound exposure level	8
4.6	Equivalent level from multiple events	10
5	Calculation of a statistical distribution	10
6	Calculation of attenuation	14
6.1	General	14
6.2	Geometric divergence	14
6.3	Atmospheric absorption	14
6.4	Insertion loss by screening objects	15
6.5	Terrain shielding	15
6.6	Contributions to excess attenuation	16
6.6.1	General	16
6.6.2	Refraction	16
6.6.3	Ground reflection and absorption	17
7	Classification	19
7.1	General	19
7.2	Classification of atmospheric absorption	19
7.3	Classification of excess attenuation	19
7.3.1	General	19
7.3.2	Lookup table requirements	20
7.3.3	Range-dependent sound speed profiles	21
7.3.4	Directed sound speed profiles	21
8	Probability of occurrence of sound speed profiles	22
8.1	General	22
8.2	Using direct measurements of wind and temperature profiles	22
8.3	Similarity relationships for the atmospheric surface layer	23
8.4	Using measurements of turbulent fluxes	24
8.5	Using routinely gathered weather station data	25
8.6	Using directly measured or calculated sound speed profiles as input	26
9	The source	26
9.1	General	26
9.2	Demolition and muzzle blasts	26

9.2.1	General	26
9.2.2	Source descriptors	27
9.2.3	Determination by measurement	27
9.2.4	Determination by estimation	28
9.3	Projectile sound	28
9.3.1	General	28
9.3.2	Flat trajectories	28
9.3.3	High-elevation trajectories and rocket trajectories	28
10	Uncertainties	28
Annex A (informative) Example of the estimation of the statistical distribution of single-event sound exposure levels		30
Annex B (informative) Uncertainty		37
Bibliography		40
