# ISO 5348:2021 (E)

## Mechanical vibration and shock — Mechanical mounting of accelerometers

# Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Basics

5 Characteristics to be specified by manufacturers of accelerometers

6 Considerations for selecting a mounting method

- 6.1 General considerations
- 6.1.1 Procedures
- 6.1.2 Conditions
- 6.2 Specific considerations
- 6.2.1 Frequency range of operation
- 6.2.2 Transducer cable
- 6.3 Determination of the mounted fundamental resonance frequency
- 6.3.1 General
- 6.3.2 Vibration excitation method
- 6.3.3 Shock excitation methods
- 6.4 Recommendations for particular types of mountings
- 6.4.1 General
- 6.4.2 Stud mounting
- 6.4.3 Adhesive mounting
- 6.4.4 Magnets
- 6.4.5 Quick mount
- 6.4.6 Probe
- 6.4.7 Conical bolting
- 6.4.8 Low-percussion mounting devices for recording human exposure to vibration
- 6.4.9 Mounting by three#point support and ground spikes
- 6.4.10 Wedge anchors
- 6.4.11 Mounting fixtures

7 Typical frequency response for various types of mounting

8 Further mounting aspects

- 8.1 Base strain sensitivity of an accelerometer
- 8.2 Thermal mounting effects
- 8.3 Electrical ground loops
