## Acoustics - Methods for calculating loudness - Part 3: Moore-Glasberg-Schlittenlacher method

---

| Contents              |   | Page |
|-----------------------|---|------|
| Foreword .....        |   | iv   |
| Introduction .....    |   | v    |
| 1                     | Scope .....   | 1    |
| 2                     | Normative references .....  | 1    |
| 3                     | Terms and definitions .....   | 1    |
| 4                     | General .....   | 4    |
| 5                     | Input signal .....  | 4    |
| 5.1                   | Single microphone .....   | 4    |
| 5.2                   | Two microphones in the ear canals or microphones in a head and torso simulator .....          | 4    |
| 5.3                   | Earphone presentation .....   | 4    |
| 6                     | Instrumentation .....   | 5    |
| 7                     | Description of the method .....   | 5    |
| 7.1                   | General .....   | 5    |
| 7.2                   | Transfer of sound through the outer and middle ear .....                                      | 6    |
| 7.2.1                 | General .....   | 6    |
| 7.2.2                 | Free-field transfer function .....  | 7    |
| 7.2.3                 | Diffuse-field transfer function .....   | 8    |
| 7.2.4                 | Signal recorded using microphones in the ear canals or using a Head and Torso Simulator ..... | 8    |
| 7.2.5                 | Earphone presentation .....   | 8    |
| 7.3                   | Calculation of the running short-term spectrum .....  | 8    |
| 7.4                   | Calculation of the running short-term excitation pattern .....                                | 9    |
| 7.5                   | Transformation of excitation into specific loudness .....                                     | 10   |
| 7.5.1                 | General .....   | 10   |
| 7.5.2                 | Reference excitation at the reference threshold of hearing .....                              | 10   |
| 7.5.3                 | Gain of the cochlear amplifier for inputs with low sound pressure levels .....                | 11   |
| 7.5.4                 | Calculation of specific loudness from excitation when $ETHRQ/E_0 \leq E/E_0$ .....            | 11   |
| 7.5.5                 | Calculation of specific loudness from excitation when $ETHRQ/E_0 > E/E_0$ .....               | 12   |
| 7.5.6                 | Calculation of specific loudness from excitation when $E/E_0 > 1010$ .....                    | 12   |
| 7.6                   | Calculation of short-term specific loudness .....   | 13   |
| 7.7                   | Smoothing of short-term specific loudness and application of binaural inhibition .....        | 13   |
| 7.8                   | Calculation of short-term loudness .....  | 15   |
| 7.9                   | Calculation of long-term loudness .....   | 15   |
| 7.10                  | Relationship between loudness level and loudness .....  | 15   |
| 7.11                  | Calculation of the reference threshold of hearing .....                                       | 16   |
| 8                     | Uncertainty of calculated loudness sounds .....   | 17   |
| 9                     | Data reporting .....  | 17   |
| Annex A (informative) | Software for the calculation of loudness according to the method in this document .....       | 19   |

|   |           |
|---|-----------|
| <b>Annex B (informative) Test signals used for verification of this document .....</b>              | <b>21</b> |
| <b>Annex C (informative) Test signals used for verification of equivalence with ISO 532-2 .....</b> | <b>24</b> |
| <b>Bibliography .....</b>   | <b>28</b> |
