Foreword 2

1 Scope 4

2 Normative references 4

3 Terms and definitions 5

4 Quantities to characterize flanking transmission 9
4.1 General 9
4.2 Normalized flanking level difference Dn,f and normalized flanking impact sound pressure level Ln,f 9
4.3 Vibration reduction index, Kij 9
4.4 Selection of the principle of measurement 11

5 Measuring equipment 12

6 General requirements for test specimens and test rooms 12

7 Measurement methods 13
7.1 Measurement of Dn,f and Ln,f 13
7.2 Measurement of the vibration reduction index with structure-borne excitation 15
7.3 Measurement of the structural reverberation time 18
7.4 Measurement of the vibration reduction index with airborne excitation 19
7.5 Frequency range of measurement 20

8 Influences from the structures of the test facility 20
8.1 Criterion to verify flanking transmissions through constructions of the test facility 20
8.2 Conventional limit for light elements compared with the surrounding elements of the test facility 21
8.3 Verification procedure for a light flanking element that is structurally independent of a separating element 21

9 Shielding 21

Annex A (normative) Single-number rating of the vibration reduction index 27

Bibliography 28
