DIN ISO 1328-2:2021-09 (E)

Cylindrical gears - ISO system of flank tolerance classification - Part 2: Definitions and allowable values of double flank radial composite deviations (ISO 13 28-2:2020)

Contents

Page

National foreword 3

Foreword 5

1 Scope 6

2 Normative references 6

3 Terms, definitions and symbols 6
3.1 Terms and definitions 6
3.2 Symbols 8

4 Application of the ISO double flank radial composite tolerance classification system 8
4.1 General 8
4.2 Gear tooth tolerance class 9
4.3 Specification of datum surfaces 9
4.4 Application of the ISO flank classification standard 10
4.4.1 Measurement equipment and master gears 10
4.4.2 Equipment verification and uncertainty 10
4.4.3 Filtering and data density 10
4.5 Acceptance criteria 10
4.6 Correlation of double flank radial composite and element deviations 10
4.7 Designation of the double flank radial composite tolerance class or tolerances 11

5 Tolerance values 11
5.1 General 11
5.2 Use of formulae 11
5.2.1 Number of teeth used to calculate tolerances 11
5.2.2 Rounding rules 11
5.3 Tooth-to-tooth radial composite tolerance, fidT 12
5.4 Total radial composite tolerance, FidT 12
5.4.1 Total radial composite tolerance for cylindrical gears 12
5.4.2 Total radial composite tolerance for sector gears 12

Annex A (informative) Graph of tolerance values for class R34, R44, and R50 for spur gears with module = 1,0 mm 13

Annex B (informative) Double flank radial composite deviation over segments of k teeth 15

Annex C (informative) Reasons for changing double flank composite tolerances 17

Annex D (informative) Conversion from another double flank composite tolerance specification....18

Annex E (informative) Calculation examples 19
