ISO/TS 12869:2019 (E)

Water quality — Detection and quantification of Legionella spp. and/or Legionella pneumophila by concentration and genic amplification by quantitative polymerase chain reaction (qPCR)

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms, definitions, symbols and abbreviated terms

3.1 Terms and definitions
3.2 Symbols and abbreviated terms

4 Principle

5 Sampling

6 General testing conditions

6.1 General
6.2 Staff
6.3 Premises
6.4 Apparatus and consumables (excluding reagents)
6.4.1 Apparatus
6.4.2 Consumables
6.4.3 Concentration
6.4.4 Extraction and PCR (detection and quantification)
6.5 Reagents
6.5.1 General
6.5.2 PCR reagents
6.5.3 Other reagents
6.6 Decontamination of equipment and premises
6.7 Treatment and elimination of waste

7 Procedure

7.1 Concentration
7.2 DNA extraction
7.2.1 General
7.2.2 Protocols
7.2.3 Stability of DNA extracts
7.3 DNA amplification by PCR
7.3.1 General
7.3.2 Target sequences, primers and probes
7.3.3 Amplification mix preparation
7.4 Quantitative detection
7.4.1 General
7.4.2 PCR protocol
7.4.2.1 Overview
7.4.2.2 General
7.4.2.3 Real-time quantification
7.5 Qualitative detection

8 Expression of the results

9 Technical protocol for the characterization and the validation of the method

9.1 General
9.2 Inclusivity and exclusivity of probes and primers
9.3 Verification of the calibration function of the quantitative PCR phase
9.3.1 General
9.3.2 Calibration curve verification principle
9.3.3 Calibration curve evaluation protocol
9.3.4 Analysis of the results
9.3.4.1 Estimation of the regression curve
9.3.4.2 Estimate and verification of the efficiency
9.3.4.3 Verification of the linear regression performance
9.3.5 Use of the calibration curve
9.4 Verification of the PCR limit of quantification, LQqPCR
9.4.1 Principle
9.4.2 Experimental design
9.4.3 Analysis of results
9.4.4 Theoretical limit of quantification of the whole method
9.5 Verification of the PCR limit of detection (LDqPCR)
9.6 Recovery method
9.6.1 Principle
9.6.2 Protocol
9.6.3 Calculations
9.7 Robustness
9.8 Measurement uncertainty of the whole method

10 Quality controls

10.1 General
10.2 Connecting the calibration solution and the reference material to the primary standard
10.2.1 Principle
10.2.2 Protocol
10.2.3 Data analysis
10.3 Monitoring of the performances
10.3.1 Calibration performances
10.3.2 Monitoring of the performances at the limit of quantification
10.4 Positive and negative controls of the method
10.5 No template control (NTC)
10.6 Inhibition control
10.6.1 General
10.6.2 The inhibition control is the target
10.6.3 The inhibition control is either a plasmid or an oligonucleotide

11 Test report

Annex A (informative) Example of protocol for producing a quantitative standard DNA solution

Annex B (informative) Example of method for determining the cycle threshold

Annex C (informative) Example of a study of the quantitative PCR phase calibration function

C.1 Table of data and calculations
C.2 Estimation of the regression curve
C.2.1 Calculation of required elements
C.2.2 Calculation of the slope a
C.2.3 Calculation of intercept point b
C.3 Verification of efficiency
C.4 Estimation of linearity performance

Annex D (informative) Specific Student distribution

Annex E (informative) Example of recovery evaluation

Annex F (informative) Example of overall uncertainty evaluation

Annex G (normative) Evaluation of the performances of a third party validated method

G.1 Principle
G.2 Verification criteria

Annex H (informative) Interlaboratory studies
