ISO 21479:2019 (E)

Soil quality — Determination of the effects of pollutants on soil flora — Leaf fatty acid composition of plants used to assess soil quality

Contents

		Foreword
		Introduction
1		Scope
2		Normative references
3		Terms, definitions and abbreviated terms
	3.1 3.2	Terms and definitions Abbreviated terms
4		Principle
5		Apparatus and reagents
	5.1 5.2	Apparatus Reagents
6		Sampling strategies
7		Sampling of leaf tissues
8		Obtaining, extraction and analyses of FAMES
	8.1 8.2 8.3	Contamination control Obtaining and extraction of FAMES from plant leaves Analysis of FAMES
9		Test report
	9.1 9.2 9.3 9.4 9.5	A reference to this document, i.e. ISO 21479 Description of the site and areas analysed Leaf sampling Fatty acid composition Conclusion
Annex	Α	(informative) Results of the ring test
	A.1 A.2 A.3 A.4	General Results obtained in Bordeaux by six laboratories Results obtained by the same investigator in different laboratories: Outcome
Annex	В	(informative) Assessment of soil quality by determining the Omega-3 index of Lactuca sativa seedlings grown ex situ under controlled conditions
Annex	С	(informative) Plant species previously successfully used to assess soils of contaminated sites (organic and/or metals)
Annex	D	(informative) Variation of the Omega-3 index as function of harvest time, plant size and leaf development
Annex	E	(informative) Effect of the quantity of foliar tissues on the FAMES composition
Annex	F	(informative) Example of chromatogram obtained after the FAMES analysis of foliar tissues
Annex	G	(informative) Recommended mathematical method to rate soils of areas when some sampled plant species are not found in all areas
