DIN EN 15242:2007-09 (E)

Ventilation for buildings - Calculation methods for the determination of air flow rates in buildings including infiltration

Contents

Page

Foreword 3

Introduction 4

1 Scope 6

2 Normative references 6

3 Terms and definitions 7

4 Symbols and abbreviations 9

5 General approach 10

6 Instantaneous calculation (iterative method) 12
6.1 Basis of the calculation method 12
6.2 Mechanical air flow calculation 13
6.3 Passive and hybrid duct ventilation 17
6.4 Combustion air flows 23
6.5 Air flow due to windows opening 25
6.6 Exfiltration and infiltration using iterative method 27
6.7 Exflitration and infiltration calculation using direct method 28

7 Applications 30
7.1 General 30
7.2 Energy 30
7.3 Heating load 35
7.4 Cooling loads 35
7.5 Summer comfort 35
7.6 Indoor air quality 36

Annex A (normative) Data on wind pressure coefficients 37

Annex B (normative) Leakages characteristics 43

Annex C (normative) Calculation of recirculation coefficient Crec 46

Annex D (normative) Conversion formulas 48

Annex E (informative) Examples of fuel flow factor for residential buildings 51

Bibliography 52
