ISO 1540:2006-02 (E)

Aerospace - Characteristics of aircraft electrical systems

Contents

Page

Foreword iv

Introduction v

1 Scope 1

2 Normative references 1

3 Terms and definitions 2

4 Requirements applicable to all systems 10
4.1 General 10
4.2 On-aircraft power sources 10
4.3 External power sources 11
4.4 Source/distribution system coordination 11
4.5 Utilization equipment 11

5 Constant frequency (CF) a.c. power system characteristics 12
5.1 General characteristics 12
5.2 Steady-state characteristics 13
5.3 Transient characteristics 13

6 Variable frequency (VF) a.c. power system characteristics 15
6.1 General characteristics 15
6.2 Consideration of CF power characteristics 15
6.3 Steady-state characteristics 15
6.4 Transient characteristics 16

7 D.C. power system characteristics 19
7.1 General characteristics 19
7.2 Steady-state characteristics 19
7.3 Transient characteristics 20

8 Requirements allocation 21

9 Utilization equipment restrictions 21
9.1 General 21
9.2 A.C. power utilization 21
9.3 Power factor 21
9.4 Load switching transients 22
9.5 Inrush current 22
9.6 Input current modulation 22
9.7 Input current distortion 22
9.8 Maximum input capacitance 23

10 Power quality associated assumptions and background 24
10.1 General 24
10.2 Background to the document scope 25
10.3 A.C. power system assumptions 25
10.4 A.C. source equipment assumptions 29
10.5 D.C. system assumptions 31
10.6 D.C. engine starting power quality 32
10.7 270 V d.c. input power 32
