## ISO/ASTM 51649:2015-03 (E)

## Practice for dosimetry in an electron beam facility for radiation processing at energies between 300 keV and 25 MeV

## Contents

1	Scope1
2	Referenced documents1
3	Terminology2
4	Significance and use
5	Radiation source characteristics
6	Documentation6
7	Dosimetry system selection and calibration6
8	Installation qualification
9	Operational qualification7
10	Performance qualification8
11	Routine process control9
12	Certification10
13	Measurement uncertainty10
14	Keywords10
Annexes	
Figure 1 I	Example showing pulse beam current (Ipulse), average beam current (lavg), (pulse width (W) and repetition rate (f) for a pulsed accelerator3
Figure 2 I	Diagram showing beam length and beam width for a scanned beam using a conveyor system
Figure 3 I	Example of electron-beam dose distribution along the scan direction, where the beam width is specified at a defined fractional level f of the average maximum dose Dmax4
Figure 4	A typical depth-dose distribution for an electron beam in a homogeneous material4
Figure 5	Typical pulse current waveform from an S-Band linear accelerator
Figure A2	2.1 Calculated depth-dose distributions in various homogeneous polymers for normally incident 5.0 MeV (monoenergetic) electrons using the Program ITS3 (19, 21)13
Figure A2	2.2 Calculated depth-dose distributions in various homogeneous materials for normally incident 5.0 MeV (monoenergetic) electrons using the Program ITS3 (19, 21)14
Figure A2	2.3 Calculated depth-dose distributions in polystyrene for normally incident electrons at monoenergetic energies from 300 to 1000 keV using the Program ITS3 (19, 20)

Figure A2.4 Calculated depth-dose distributions in polystyrene for normally incident electrons at monoenergetic energies from 1.0 to 5.0 MeV using the program ITS3 (19, 20)	16
Figure A2.5 Calculated depth-dose distributions in polystyrene for normally incident electrons at monoenergetic energies from 5.0 to 12.0 MeV using the program ITS3 (19, 20)	17
Figure A2.6 Calculated depth-dose distributions in AI and Ta for normally incident electrons at a monoenergetic energy of 25 MeV using the program ITS3 (19, 24)	18
Figure A2.7 Superposition of calculated depth-dose distributions for aluminum irradiated with 5- MeV monoenergetic electrons from both sides with different thicknesses (T) and from one side using experimental data presented in Refs (18 and 25) (see Notes A2.2-A2.4)	18
Figure A2.8 Calculated correlations between incident electron beam energy and optimum thickness Ropt, half-value depth R50, half-entrance depth R50e, and practical range Rp for polystyrene using data from Fig. A2.3 and Fig. A2.4 (see Table A4.1)	19
Figure A2.9 Calculated correlations between incident electron beam energy and optimum thickness Ropt, half-value depth R50, half-entrance depth R50e, and practical range Rp, for polystyrene using data from Figs. A2.4 and A2.5 (see Table A4.1)	19
Figure A2.10 Measured depth-dose distributions for nominal 10 MeV electron beams incident on polystyrene for two electron beam facilities (26, 27)	20
ISO/ASTM 51649:2015(E) Figure A2.11 Depth-dose distributions in stacks of cellulose acetate films backed with wood, aluminum, and iron for incident electrons with 400 keV energy (30)	s 21
Figure A2.12 Depth-dose distributions with 2 MeV electrons incident on polystyrene absorbers at various angles from the normal direction (31)	21
