ISO 22415:2019 (E)

Surface chemical analysis — Secondary ion mass spectrometry — Method for determining yield volume in argon cluster sputter depth profiling of organic materials

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Symbols (and abbreviated terms)

5 Requirements

5.1 Test samples
5.2 Sputtering ion source
5.3 Analysis conditions

6 Data Acquisition

6.1 Analysis
6.2 Minimum data requirements
6.3 Data quality

7 Calculation of sputtering yield volume

7.1 Introduction
7.2 Determination of sputtering yield volume for a single layer profile
7.2.1 Introduction
7.2.2 First interface position
7.2.3 Interface position between two materials
7.2.4 Sputtering time
7.2.5 Calculation of sputtering yield volume using a single layer thickness
7.3 Determination of sputtering yield volume from profiles of layers of more than one thickness
7.3.1 Introduction
7.3.2 First interface
7.3.3 Interface between two materials
7.3.4 Areic dose of ions used for sputtering
7.3.5 Calculation of sputtering yield volume using more than one-layer thickness

8 Reporting of sputtering yield volume

8.1 Required information

Annex A (informative) Sputtered area and sputtering beam width

A.1 Measurement of sputtered area
A.1.1 Dimensions
A.1.2 Measurement using a grid
A.1.3 Example

Annex B (informative) Examples of depth profile data

B.1 Schematic depth profiles
B.2 Examples
B.2.1 Example single buried layer measurement
B.2.2 Example multiple layer measurement

Annex C (informative) Estimation of sputtering yield volumes for argon clusters

C.1 Empirical description
C.2 Relationship between cluster size and yield uncertainties
