ISO 22278:2020 (E)

Fine ceramics (advanced ceramics, advanced technical ceramics) — Test method for crystalline quality of single-crystal thin film (wafer) using XRD method with parallel X-ray beam

Contents

Foreword

Introduction

1 Scope

2 Normative references

3 Terms and definitions

4 Fundamentals

5 Devices and instruments

5.1 Schematic diagrams
5.2 X-ray generator
5.3 X-ray mirror
5.4 Monochromator
5.5 Sample attachment
5.6 Goniometer
5.7 Detector
5.8 Instrument calibration

6 Preparation of sample

7 Test method and procedure

7.1 Optics alignment
7.2 Sample alignment
7.3 Adjusting the initial position of goniometer
7.3.1 Symmetric diffraction
7.3.2 Asymmetric diffraction
7.4 Microscopic position adjustment of goniometer (Φ and χ axes) and ω scan
7.4.1 Symmetric diffraction
7.4.2 Asymmetric diffraction
7.5 Crystalline quality measurement method of single-crystal wafer
7.5.1 General
7.5.2 Selecting the flat zone position of wafer
7.5.3 Arranging the fixed size of the square
7.5.4 Measuring the FWHM value of RC
7.5.5 Interference effect by the wafer's curvature
7.5.6 Doped epitaxy film on a single-crystal thin film substrate

8 Data analysis

9 Test report

Annex A (informative) Example of d-spacing, 2θ, χ value (tilt angle) and relative ideal intensity of the symmetric and asymmetric diffraction on the SiC single-crystal thin film (wafer)

Annex B (informative) Determination of d-spacing, 2θ, χ value (tilt angle) and relative ideal intensity for the symmetric and asymmetric diffraction on the single-crystal thin film (wafer)

B.1 General
B.2 Method for determining d-spacing and 2θ calculation

B.3 Method for determining χ value (tilt angle) for measuring peaks in single crystals
B.4 Method for determining relative ideal intensities and structure factors

Annex C (informative) Results of interlaboratory test
