

DIN 51834-5:2024-06 (E)

Testing of lubricants - Tribological test in the translatory oscillation apparatus - Part 5: Quantification of the friction-induced noise development of brake fluids in EPDM-metal contacts

Contents		Page
Foreword		4
Introduction		5
1	Scope	6
2	Normative references	6
3	Terms and definitions	7
4	Variables	7
5	Principle	8
6	Reporting of the overall test result	10
7	Apparatus and reagents	10
8	Sampling	13
9	Preparation	13
10	Procedure	14
10.1	General	14
10.2	Installation of the test specimens in the test chamber for PDR preconditioning	14
10.3	Start of the test run	15
10.4	Termination of the test run	16
11	Evaluation	16
11.1	Quantitative determination of μ from the friction force signals	16
11.2	Quantitative Determination of SFC (static friction coefficient) from the friction force signals	19
11.3	Determination of the overall test result	20
11.4	Number of tests	20
12	Reporting results	20
13	Precision	22
13.1	General	22
13.2	Repeatability, r	22
13.3	Reproducibility, R	22
Annex A (normative) Standard reference elastomer		24
A.1	General	24
A.2	Formulation	24
A.3	Recommended mixing procedure	25
A.4	Vulcanization and post-treatment	26
A.5	Control material parameters	26
Bibliography		27

Figures

Figure 1 — Contact situation with the test alignment.....	5
Figure 2 — Sequence of the test	5
Figure 3 — Repositioning of the EPDM test disc according to the PDR method for the subsequent test run with 15 operating points.....	9
Figure 4 — Schematic representation of the insert (left), installation situation in the holder (centre) and alignment of the preconditioning mark (right).....	12
Figure 5 — Mathematical evaluation of the standard deviation $\sigma(\Delta)$	18
Figure 6 — Mathematical evaluation of the quantity SFC	19
Figure 7 — Example of a graphical visualization of $\sigma(\Delta)_{\text{mean}}$ (left: noisy; right: assumed not noisy)	20
Figure 8 — Example of graphical visualization of SFC_{mean} (left: noisy; right: assumed not noisy).....	21
