## Magnetic fusion facilities - Requirements for the safety systems raised by the application of the superconducting technology

---

<b>Contents</b>		<b>Page</b>
Foreword .....		iv
Introduction .....		v
1	Scope .....	1
2	Normative references .....	1
3	Terms and definitions .....	1
4	Application of superconductivity in fusion facilities .....	4
4.1	Overview of the superconducting magnet system .....	4
4.1.1	General .....	4
4.1.2	Cryogenic technology needed in superconducting magnet system .....	4
4.1.3	Auxiliary systems to the superconducting magnet system .....	5
4.2	Safety systems present in fusion facilities .....	5
4.2.1	Confinement system .....	5
4.2.2	Nuclear shielding system .....	5
4.2.3	Auxiliary safety system .....	6
5	Requirements for confinement system .....	6
5.1	General .....	6
5.2	Requirements associated with the presence of superconducting magnets .....	6
5.3	Protection of confinement system against magnetic energy .....	7
5.4	Protection of confinement system against other hazard .....	7
6	Requirements for radiation protection .....	8
6.1	Safe operation .....	8
6.2	Maintenance and reparability .....	8
7	Requirements specific to other systems .....	10
7.1	Plasma performance monitoring system .....	10
7.2	Magnetic diagnosis and monitoring system .....	10
7.3	Quench detection and protection system .....	10
7.4	Diagnosis and monitoring system in support of confinement systems .....	11
7.5	Other requirements .....	11
Annex A (informative)	Example of Paschen curve .....	12
Annex B (informative)	Examples of radiation design limits for super-conducting coils in ITER and DEMO .....	13
Annex C (informative)	Examples of peak factors used in the ITER one dimensional neutronic design analyses .....	14
Annex D (informative)	Vacuum vessel, first wall and blanket examples .....	15
Annex E (informative)	Arcing prevention in superconducting magnets .....	17
Bibliography .....		19
