Protective clothing against heat and flame - Part 2: Skin burn injury prediction - Calculation requirements and test cases

Contents	Page
Foreword	iv
Introduction	v
1 Scope	1
2 Normative references	1
3 Terms and definitions	1
4 General	3
5 Apparatus, specimen preparation and test procedure	4
6 Predicted skin burn injury calculation	4
6.1 Skin model	4
6.1.1 General	4
6.1.2 Manikin sensor heat flux values as function of time	4
6.1.3 Determination of the predicted skin and subcutaneous tissue (adipose) internal temperature field	4
6.1.4 Initial and boundary conditions	7
6.1.5 Determination of the value for the prediction of skin burn injury	7
6.1.6 Time to pain	8
7 Skin burn injury calculation test cases and in situ calibration	9
7.1 Test cases and in situ calibration	9
7.2 Skin layer temperature prediction test cases	9
7.2.1 General	9
7.2.2 Case one	9
7.2.3 Case two	9
7.2.4 Accuracy requirement	9
7.3 Skin burn injury calculation test cases	10
7.4 In situ calibration of burn injury prediction	11
8 Test report	12
8.1 General	12
8.2 Skin model	12
8.3 Calculated results	13
8.3.1 General	13
8.3.2 Predicted area (%) of manikin injured based on the total area of the manikin containing heat flux sensors	13
8.3.3 Predicted area (%) of manikin injured based only on the area of manikin covered by the test specimen	13
8.3.4 Other information	13
Annex A (normative) Skin model with temperature-dependent thermal conductivity, $k(x,T)$	14
Annex B (informative) Inter-laboratory test data burn injury prediction	16
Bibliography	18
