Figure 3 — Raw information can be stored in a database, enabling flexible and multiple ways of presentation 14

Figure 4 — An Information Model defines structures of abstract data that can be implemented in a Data Model 15

Figure 5 — A Data Model realizes the defined structure from the Information Model. 15

Figure 6 — Key structure of a knowledge topic (KT) 16

Figure 7 — Application process of knowledge topics (KT) to a specific medical device (MD) in order to generate corresponding knowledge units (KU), which fulfills the regulatory requirement addressed by the KT 18

Figure 8 — Topic Collections can be used to group KTs context specific 20

Figure 9 — Example 1 highlights two application rules: A Topic Collection can be used to group KTs in the context "Intended Purpose/Intended Use" and the field "expandable" emphasizes the individual selection of KTs 21

Figure 10 — Example 2 accentuates the feature to create individual, company-specific KTs that can, similar to predefined KTs, be connected to a Topic Collection as well 22

Figure 11 — Example 3 emphasizes the possibility to set relationships to more than one Topic Collection 23
